FLORISTS' EXCHANGE

We are a straight shoot and aim to grow into a vigorous plant

A WEEKLY MEDIUM OF INTERCHANGE FOR FLORISTS, NURSERYMEN, SEEDSMEN AND THE TRADE IN GENERAL

Vol. XXIV. No. 1

NEW YORK AND CHICAGO, JULY 6, 1907

One Dollar Per Year

CARNATION WINSOR

The most talked about carnation at the Toronto Convention.
Won first prize for best 100 pink

Winsor is so good and its merits have been so generally recognized that it has practically sold itself. Our advance orders were very large, and we did not feel the necessity of advertising it until we were in a position to fill and take care of our early orders. We are now nearly caught up with our advance orders, and have a fine lot of stock in the cutting bench, so that we can promise prompt delivery on orders received from now on.

If you have not already purchased a stock of this, you should lose no time doing so. We have sold more Winsor

than has ever been sold of any novelty that has ever been put on the market. Its merits and value are now so well established that one is not buying a chance. We are cutting and shipping right along between one and two thousand flowers a day to the New York market where our flowers are sold.

There is nothing on the market that approaches Winsor today in carnations. It is the best seller on the market, on account of its lovely color, fine stem, perfect calyx, and fine keeping and shipping qualities, in fact, in this regard it covers every necessary requisite as a market variety.

From a growing standpoint, it leaves little to be desired. It is unusually healthy, very vigorous and productive, and, we think, the most profitable carnation ever introduced. This may seem high praise for a carnation, but it is no exaggeration. Winsor gives a large percentage of high quality flowers. It practically does not split at all, notwithstanding the fact that we have had the darkest, dullest winter we have ever had, when the Enchantress and Lawson types are splitting badly all over the country with everyone, we have not had one-half of one per cent. of split calyxes on the Winsor. In fact, we seldom see a split calyx. Hundreds of florists who have been at our Scarborough place will substantiate this statement, extravagant as it may appear.

Anyone who fails to plant Winsor this year will regret it. Rose pink Enchantress is good, and a good many other varieties are good, but IF YOU WANT THE WINNER, PLANT WINSOR.

Strong Rooted Cuttings. \$12.00 per 100, \$100.00 per 1000.

PREPARE FOR CHRISTMAS

Novelties, always sell during the holidays. If you have not already grown them, try some Pink or Rose Speciosums. If potted in July, will flower for Thanksgiving and Christmas. Always useful either for cut flowers or plants. Ask the leading florists in Pittsburg, Cleveland, Detroit, Buffalo, or around New York City. Order to-day. Will ship any time.

Cold storage Liliun longiflorum and gigantheum take about two months to bloom from time of potting; speciosums from five to six months, so that longiflorum wanted for Thanksgiving and Christmas should be planted about Oct. 1, and speciosums in July.

All Cases are Re-packed Before Shipment

Liliun Longiflorum Giganteum, 7 to 9-in. bulbs, 300 in case, \$9.00 per 100, \$80.00 per 1000.
 Liliun Longiflorum Multiflorum, 9 to 10-in. bulbs, 200 in case, \$11.00 per 100; \$100.00 per 1000.
 Liliun Speciosum Robrum, 8 to 9-in. bulbs, 200 in case, \$8.00 per 100; \$76.00 per 1000; 9 to 11 in. bulbs, 160 in case, \$12.60 per 100; \$110.00 per 1000.
 Liliun Speciosum Melpomene, 8 to 9-in. bulbs, 200 in case, \$9.00 per 100; \$80.00 per 1000; 9 to 11-in. bulbs, 160 in case, \$12.00 per 100; \$116.00 per 1000.

Full cases sold at 1000 rate.

Seed Trade Report.

AMERICAN SEED TRADE ASSOCIATION

George S. Green, Chicago, Ill., president; M. H. Duryea, New York, first vice-president; F. W. Bolgiano, Baltimore, Md., second vice-president; C. E. Kendel, Cleveland, O., secretary and treasurer.

SEED TRADE CONVENTION

ECHOES.—At the close of the business sessions the members adjourned to the reception room of the Hotel Astor where, in a neat speech, Walter P. Stokes, on behalf of the association, presented to retiring President Wood a fine binocular field glass. Mr. Wood made a suitable response, expressing his appreciation of this token of the association's esteem, and thanking all for their support during his term of office.

The veteran seedsman, C. L. Allen, who a few days before the meeting had passed his seventy-ninth birthday, which event was properly celebrated by his relatives and friends, was an interested delegate, as he always is. It was a neat tribute that Mr. Willard paid to Mr. Allen in his address; the records of the American Seed Trade Association are greatly enhanced by Mr. Allen's valuable contributions thereto.

Professor Galloway has hopes that the present system of governmental free seed distribution will be done away with in time, and is working toward that end. The sooner the better, for as Mr. Forbes correctly states in his able paper on the subject, "Nobody but Congressmen wants free seeds."

The portrait of first vice-president M. H. Duryea, appearing in last week's issue, was reproduced from a snapshot, hurriedly taken. This is a case where the camera does not tell the exact truth; Mr. Duryea is a good-looking man, more so than the photo-engraving presents him to be.

The banquet was a "glorious and memorable occasion," and "a regal feast" was furnished. Everybody present endorses the description.

There are many valuable points in President Wood's address which should be carefully studied by all interested; among them improvement of stocks, and the advancing of prices. The doing away with discounts, premiums, etc., would take the seed trade out of the "nature fakir" class. The plan is not at all a dignified one.

The committee work done during the year forms a valuable adjunct to the convention proceedings, and the beauty of it all is, that all the committees work.

The suggestion of Mr. Willard, to the effect that an index of all the subjects treated upon by the association during the past quarter century be compiled and distributed, is an excellent one, worthy of emulation by the S. A. F. O. H.

"ALFALFA IN INDIANA" is the title of bulletin 122, volume 13 of the Purdue University Agricultural Experiment Station; it deals with results of experiments in late Summer seeding, and furnishes suggestions for beginners in alfalfa culture.

THE FLORISTS' EXCHANGE

BLUEGRASS HARVEST.—This year, the crop of Kentucky bluegrass will, it is estimated, only run 75 per cent. of the normal crop, and if 400,000 bushels are gathered the dealers will be surprised. The price now is \$1.75 per bushel for clean seed, but the normal price is much less than that sum, and has dropped down as low as 80 cents a bushel.—Exchange.

GRASS AND OTHER SEEDS to the value of \$46,571 was exported from Mainz, Germany, to the United States during the year 1906.

The value of roots, bulbs, and plants exported from Leipzig, Germany, to the United States during the year 1906 was \$20,297 as compared with \$16,619 in 1905. The value of the seeds from the same point in 1906 was \$48,796, and in 1905, \$31,280.

IMPORTS OF SEEDS, ETC.—June 24.—S. D. Crosby Company, 15 bushels garden seed; J. M. Thorburn & Company, eight bags grass seed. June 26.—J. P. Roosa, 12 bags grass seed; H. J. Weber, one box live plants; H. W. Leeler & Company, two boxes orchids; Maltus & Ware, 16 boxes orchids. June 27.—Hensel, Bruckman & Lorbacher, one case live plants. June 28.—Vaughan's Seed Store, seven cases bulbs. June 29 and 30.—Maltus & Ware, one case live plants; H. Nungesser & Company, 59 bags field seed; A. Olsen, 150 bags clover seed; J. M. Thorburn & Company, one bag seeds; J. P. Roosa, 25 bags seed.

EXPORTS OF SEEDS, ETC.—June 28.—Shipped from New York to London, 27 packages seed, valued at \$353; 29 packages seed, valued at \$318; to Savannah, 27 bags seed, valued at \$303.

COLUMBUS, O.—George G. Beers, formerly of Bridgeport, Conn., and who is now connected with the Livingston Seed Company, of this city, will represent that firm on a business trip through Europe. He left New York by SS. St. Paul last Saturday, and, landing at Cherbourg, will visit Paris, Belgium and Holland, inspecting the bulb fields and roses; thence he will journey through Germany, stopping at the seed centers of Quedlinburg and Erfurt; from there he goes to Denmark to look up the cabbage and cauliflower industry; after that to Sweden, returning by Southampton after an absence of about eight weeks.

SHENANDOAH, IA.—Incorporation papers have been filed for the Henry Field Seed Company, which began business July 1, taking over Henry Field's seed business. There will, however, be no change in the management, as Mr. Field will hold half the stock and will be the manager of the company. The list of officers and directors is as follows on temporary organization: Directors: Henry Field, Chas. Simpson, H. E. Eaton, Ben.

G. Russell, A. L. P. Thompson, S. E. Field, D. S. Lake. Officers: Henry Field, president; Chas. Simpson, vice-president; H. E. Eaton, secretary and treasurer.

Extensive building plans are a part of the program. The company is organized with \$75,000 capital stock, which is already all or practically all subscribed. The building will be one of the finest seed buildings in the State.

LILY EXPERIMENTS.—In a recent investigation Professor S. W. Collett, of the Washington State college, acted upon the assumption that self-sterility in the Bermuda lily was due to a constitutional weakness, probably caused by inbreeding, and a cytological study has confirmed this decision, in part, and a more extended study will, it is believed by Professor Collett, confirm his theory.

The most striking phenomenon in the study was the disintegration of the chromatin in the pollen cells so that it was exceptional to find a perfect pollen grain. There was no definite evidence of abnormality in the development of the ovule, but the experiments in cross-fertilization proved that such must be the case.

Fifty typical plants were cross-fertilized with pollen from the Liliun giganteum. Just one-half produced seed in every pod, while in the other half every pod failed to produce seed, thus showing an abnormality in ovule development. This was no doubt due to lack of correlation.

The seeds from the cross were planted last February, and have grown nicely. This is taken as proof by Professor Collett that cross-fertilization of the Bermuda lily with the giant lily will produce a new species having the desirable qualities of each.

PURE SEED VERSUS POOR SEED.—The Kansas Experiment Station recently published a special circular comparing the cost of obtaining a full stand of alfalfa when pure and poor seed are used. Attention is called to the fact that in 1905 Kansas had an area of 1,018,206 acres devoted to cultivated forage crops, of which 602,560 acres was in alfalfa. The cost of seeding this alfalfa acreage at the rate of 15 pounds per acre with seed at 16 cents per pound, every single seed being good, would amount to \$1,446,128, but taking as a basis from among the number of alfalfa seed samples analyzed by the station 28 showing an average of total impurities of 46.1 per cent. and an average number of seed true to name but incapable of germinating of 34.5 per cent., it would have cost \$1,935,042 to secure a full stand on the same area.

Letters from all portions of the State indicate that poor alfalfa seed is quite common. The principal impurities are dead and defective alfalfa seed itself, trefoil, English plantain or buckhorn, dodder, Russian thistle, crab grass, foxtail, and other weed seeds, and the adulterants often found are trefoil, bur clover, and sweet clover. It is pointed out that with good standard alfalfa seed, averaging 83 per cent. of the seed true to name and capable of germinating, the cost of seeding an acre would be \$2.40. This represents the actual cost of the 83 per cent. of good seed, the 17 per cent. being waste, and the real cost per bushel of viable seed is therefore about \$12 instead of \$10, at which the seed and the waste together was originally bought. In a certain sample of seed analyzed by the station only 20.2 per cent. of the seeds were true to name and capable of germinating. A computation based on the cost of the standard seed shows that in order to obtain from the use of this poor seed as much of a stand as could have been secured with 15 pounds of the standard seed 73.9 pounds of this seed would have been necessary, and the actual cost of seeding an acre would have been brought up to \$11.92, and the actual cost of the seed exclusive of the 79.8 per cent. of waste to \$49.26 per bushel. In addition to this prohibitive cost, the use of seed like this sample would have deposited on each acre over 4,000,000 weed seeds of various species, or 105 on each square foot. The use of seed represented by another sample studied would have raised the cost to \$5.75 per acre, and would have sown this area with approximately 167,000 weeds of various sorts, including 95,000 plantain seed, 19,000 dodder seed, and 25,000 foxtail seed. Bad seed gives a weak, poor stand of alfalfa and a dense growth of weeds and wild grasses. In the 28 samples referred to above the impurities ranged from 21.6 to 100 per cent., the trash or dirt from 0.3 to 31.9 per cent., and the number of kinds of foreign seed present from 3 to 34. These investigations with reference to bluegrass seed within the State show

Stokes Seed Store
219 MARKET ST., PHILADELPHIA.

that Kentucky bluegrass seed is extensively adulterated with Canadian bluegrass seed, from which it is not distinguishable by the ordinary observer, especially when mixed with it. English bluegrass is very commonly adulterated with cheat, the seeds of the two plants resembling each other sufficiently to make adulteration easily possible. The quality of English bluegrass seed is frequently very poor, the germination in many cases not being above 40 per cent. A certain lot of this seed bought and sold in the Fall of 1905 contained less than 50 per cent. of germinable seeds, and the percentage of weed seeds was so high that on each acre there were sown with the English bluegrass seed 142,230 seeds of crab grass, 111,000 seeds of dock, 393,670 smartweed seeds, 62,340 cheat seeds, together with 111,000 miscellaneous seeds, making a grand total of 820,240 weed seeds of all kinds. The crop harvested contained only about 15 per cent. of English bluegrass seed, while 79 per cent. was cheat and the rest seeds of such weeds as bindweed, dock, foxtail, and pigweed.

The brome grass seed marketed in the State is also adulterated with cheat, and much of it has a percentage of germination of only about 40.

It is believed that seed market conditions will not be improved without legislation, and it is pointed out that a law excluding from sale any seed with a percentage of germination below 75 would make a saving of at least 10 per cent. each year, or of a total amount of nearly \$22,000 on forage crops alone. A seed law proposed for the State requires a guaranty of 85 per cent. of germination and imposes a tax of one-fifth of a cent. on all seed packets less than one pound and of one-fifth of a cent. per pound for all seed in bulk, and it is estimated that the operation of this law would save the State of Kansas 14 per cent. net annually in cost of alfalfa seed and 25 per cent. net in all other forage crops and above the tax.

NOTES FROM ERFURT.—As usual in this section the Spring has been a late one, with sudden and violent changes in the weather; cold, semi-tropical heat, and heavy rains following rapidly on each other's heels. Nevertheless, vegetables are mostly looking well, though radishes in some regions have lacked sufficient moisture.

A glance over the fields shows most things backward, pansies being hardly in full bloom. Forget-me-nots look all right and the vivid-hued single wallflowers are making a good show. Planting is not yet finished and it is hard work to keep down the weeds. Annuals are coming through strongly. Sweet peas having made a good braird this year. Perennials are behind time, but aquilegias, campanulas, and others are doing their best to brighten up the long stretches of grey soil. The increased demand for seed of perennials is quite a noteworthy feature of the last few seasons, and due no doubt to the development of amateur gardening. On the stages the Winter stock and double wallflowers are looking well and the remainder of the carnations are struggling after the Winter set-back to regain health and strength.

In the glasshouses cyclamen and primulas are standing full of pods, while cinerarias are just drooping and the hands are already beginning to

Herbaceous Border Notes.

For the past ten days the borders have been a wealth of peonies. A few excessive hot days was rather severe on many of them, and then a wind and rain storm in some sections made them rather bedraggled looking for the rest of their season. There are many fine varieties of these flowers, but the average grower will feel contented if he has a couple of dozen of good kinds.

There are now many showy plants in bloom, and one I wish to call particular attention to is *Clematis recta*. This plant grows to a height of about two and a half to three feet, and is a glorious mass of white flowers. I have often thought what a useful subject this might be to many a florist who has a retail trade, at this season of the year.

The hybrid delphiniums are just about at their best, and there are many fine spikes of bloom among them. These plants will continue to throw more flowers all summer if the first crop is cut off as soon as past. Besides the hybrids of this flower, which are mostly of the species *chinensis*, there is that fine blue form *formosum*; a tall growing species is *caucasicum*. *Delphinium caschmerianum* is quite distinct, growing to a height of about eighteen inches; it is now beginning to bloom. *Delphinium nudicaule* is a scarlet flowered species, but is rather difficult to get to grow well.

Many of the campanulas are now attractive. The fine Canterbury bells are just in their glory; these are biennials, but are well worth growing. *Campanula persicifolia* in several forms is very fine. *Morheimi* is one of the newer forms which is exceptionally fine. *Campanula glomerata* var. *Daurica* is one of the best; the flowers are of a very dark blue color and it is always an attractive border plant.

Many of the dianthus are yet in bloom and especially fine are the plumarius varieties. The foxgloves are showy at this season. The *Digitalis purpurea* sorts are mostly biennials and do best grown as such. There is a yellow flowered variety which is a good border plant.

Some of the lilies have already begun to live up to the borders. *Lilium tenuifolium* is a very pretty variety, small in size with pretty red blossoms which would be more freely grown if better known. *L. colchicum* has light yellow flowers; and several of the varieties of *L. elegans* are now attractive.

Thermopsis carolina is a pretty border plant with spikes of bright yellow flowers.

Valeriana officinalis is an old-fashioned flower known under the common name of garden heliotrope; a clump of it makes a welcome addition to the border. *Helenium Hoopesii* is the only sneezewort yet in bloom, but it is a variety well worth growing. The *Gypsophila*s are useful plants for cutting to mix with other flowers. *G. paniculata* is mostly used for this purpose. *G. cerastioides* is a low growing variety, but has larger individual flowers than the former. The *Tradescantias* are now in bloom and they are fine plants, with their pink or blue flowers. *Gillenia stipulacea*, the American *ipeacac*, is a plant well worthy of a place in the border.

*Pentstemon*s comprise a large list of varieties which are useful in the border; not many of them are in bloom yet. *P. ovatus* is one of the earliest to flower, but *P. laevigatus* *digitalis* is one of the best. *P. barbatus* is also very good, and better is its variety *Torreyi*, which is just coming into bloom.

Ethionema grandiflora is a very pretty dwarf shrubby plant, which, with its beautiful pink flowers, has been very attractive for some time. *Anchusa italica* is a pretty blue flowered plant, the variety *Dropmore* being an improvement on the species. Another variety well worth growing is *L'arrilleri*, not quite so tall growing as the first named.

Spiraea Aruncus is very showy at present with its beautiful plumes of white flowers; the other species are not yet in bloom unless it be the

meadowsweet, which is now known as *Ulmaria filipendula*.

Several species of *lychnis* still continue masses of bloom especially the varieties *viscaria splendens* and *flos-cuculi flore pleno*. The *gaillardias* have begun to blossom and will continue to do so for the rest of the season. What a useful plant *Gaillardia grandiflora* is! Flowers may be cut from it continuously during the season. Many of the irises are yet in flower, although the most showy at present are the Siberian and that moisture loving species *pseud-acorus*. The Japanese forms will soon be in flower, and what glorious plants they are, with their beautiful, large blossoms and colors surpassing those of any of the others of this class of plants.

JOHN W. DUNCAN.

Plant Notes.

EUCHARIS AMAZONICA.—This plant's capability of flowering is by no means restricted to any season, or even to one crop during the year. On the contrary, the plants can be bloomed twice and even three times. All that they are absolutely in need of to perform this is to have a reasonable period of rest—three weeks or a month being all sufficient for that purpose. Some assert that *eucharis* can be made to resume the production of flowers through merely checking the plants by removing them into a house where the temperature is decidedly lower than that of the one where they flowered. But even if that method were practical there would be little if anything gained by its adoption, because the flowers would be fewer in number and inferior in quality to those obtained had the plants been given the benefit of a few weeks' rest.

The *eucharis* is easily propagated by division, and anyone in possession of a few bulbs can add to his stock considerably in a few years. Each bulb will produce three or four in one season, and these may be taken off and be repotted separately, or they may be left growing together until the whole forms one good sized clump.

While the *eucharis* may flower just as well when potbound or after being established, for two or more years, it will be found more satisfactory to repot the plants every year after flowering. In repotting care should be taken to disturb the roots of the plants as little as possible. After potting the plants should be placed in a temperature of at least 65 degrees at night. They should be shaded from sunlight, especially after being repotted.

The soil best suited for *eucharis* is composed of good fibrous sod with the addition of a good sprinkling of well rotted cow manure, bone meal, and sand. It is very important that the pots have ample drainage, because the plants require an abundance of water, which must have free access to escape from the soil, otherwise the soil would become sour and be rendered unfit for the roots of the plants to live in. A layer of moss should be placed over the crocks so that the soil will not be liable to obstruct the drainage.

When it is desired to bloom plants in small pots, one good bulb may be potted into a 5 or 6-inch pot. At the appearance of growth the plants must be pushed ahead without any interruption until the leaves are of full size and matured. Growth is then completed, and the plants ready for their period of rest, which, if given them, the grower will be rewarded with an abundance of bloom.

The *eucharis* being an evergreen bulb, it should not be dried off to such an extent as to cause the foliage to wither entirely; on the contrary, water is just given the plants after growth has been completed, in quantity sufficient to keep the foliage from flagging, and the plants removed to a cooler temperature, there to remain for three weeks or a month, as already noted. When that period has elapsed they may be brought back into the house whence they were taken and flowered; or the temperature may be increased to 65 degrees at night where they have been at rest and flowered there.

Eucharis will succeed in a bench if treatment somewhat similar to that given in pots can be afforded them when the bench method is adopted. Thrips and mealy bugs are enemies of *eucharis*, but constant syringing will keep these insects in check. D. M.

NURSERY DEPARTMENT.

Conducted by Joseph Meehan.

AMERICAN ASSOCIATION OF NURSERYMEN.
J. W. Hill, Des Moines, Ia., president; C. M. Hobbs, Bridgeport, Ind., vice-president; George C. Seager, Rochester, N. Y., secretary; C. L. Yates, Rochester, N. Y., treasurer.

The June 1907 bulletin of the American Association of Park Superintendents contains interesting views of the park men on "Roads, Drives and Paths and their Construction," "Ashes and Cinders for Filling," "Herbicides," "Evergreens for Parks," and "Fertilizer."

AMERICAN ASSOCIATION OF PARK SUPERINTENDENTS.
The date of the annual meeting to be held at Toronto, has been changed to August 15, 16 and 17, with headquarters at Queens Hotel. The business meetings will be held in the City Hall.

The following provisional program has been arranged:
August 15th, Morning. Reception of visitors and address of welcome by the Mayor of Toronto.

Usual business—Election of Officers, President's Address, etc.

August 15th, Afternoon. 2 P. M. Drive through City Parks, etc.

August 15th, Evening. Business—Reading of papers and discussion thereon.

August 16th, Morning. 9.30 A. M. Automobile trip.

August 16th, Afternoon. 2 P. M. Trip by boat around Toronto Island.

5 P. M. Luncheon at Island Park.

August 16th, Evening. Business meeting.

Arrangements are not fully made for August 17 at this time.

Papers and discussions will be features of the business session.

Delegates are promised by the Canadian friends the time of their lives, so be sure to be on hand.

Later, further details will be sent out including information concerning routes and rates.

F. L. MULFORD, Secretary-Treasurer.

Harrisburg, Pa.

A Practical Nursery Label.

In a recent issue of The Rural New Yorker, Dr. Van Fleet describes a very serviceable nursery label used, and, we believe, gotten up by the Elm City Nursery Company, New Haven, Conn. The label, which is not patented, "consists of a piece of hard wood 1½ by two inches and a foot long in dimensions. One surface is smoothly planed and to the other is securely stapled a loop of well galvanized, heavy telegraph wire, the free ends forming a pair of legs nearly two feet long. These are deeply thrust in the soil, diverging as they enter and form a good support. The smooth front surface of the wood may be coated with white lead paint and the name written with a heavy black lead or graphite pencil, making a record that will endure several years, or rendered more durable still by writing on a sheet of weathered zinc, tacked to the surface. The Elm City Nursery people say this is the most durable and satisfactory label they have ever used. It is lasting, never overthrown by frost, not easily knocked out of place or turned around by singletrees in horse cultivation. This last is quite an important item, as most nurseries set their labels so that the rows of plants or trees start from the back. If turned about, especially among varieties not easily distinguished apart in certain stages of growth, much confusion may ensue in filling orders. The ordinary stake label is particularly liable to this mishap, but the springy diverging legs of the Elm City label seem well calculated to prevent it. Not the least of its advantages would appear the ease with which it can be taken up and replaced when necessary to hoe out grass and weeds that may grow about it. All who have tried to pull out a deeply driven stake or reset it without a heavy driving tool at hand, will appreciate this feature. With slight modifications this label would appear as well adapted to parks and private pleasure grounds as for nursery use."

Seasonable Notes.

This is the time to propagate trees and shrubs both by layers and by cuttings of young wood. The great demand for shrubs the past year shows no sign of diminishing. On the other hand, every sign points to a still larger call than ever before.

Japanese maples can be increased by layering, grafting or inarching. The common stock, polymorphum, is the one to use, as all the various handsome leaved sorts are varieties of it, and so, of course, grow well on it. Layering is in order now.

The Japanese plums have proved a boon to our fruit

growers, giving good crops every year and without so much care to keep down curculio as the older cultivated ones require. But for all that the European sorts are wanted as well as the others, because of their better quality. One of them, the Reine Claude, represents the old Green Gage type; another, the Monroe, was, and may be yet, the favorite one for canning.

Plant anything known to be of a half hardy nature in a position where it will make a short growth which will ripen thoroughly before Winter sets in. High ground suggests itself, also ground not over rich. In addition let it be a situation sheltered from high winds in Winter. The lower the mercury the greater the evaporation.

Gordonia pubescens is one of the handsomest and rarest small trees in cultivation. It is rare because of a supposed difficulty in propagating it—a difficulty purely imaginary. Cuttings of half ripened shoots put in now or any time in Summer root freely. This *Gordonia* has long been extinct in a wild state.

Nurserymen looking for a supply of Mazzard cherry stones from which to raise a supply of seedlings will need to look at once for them, if the Pennsylvania crop is any guide as to their scarcity. Cherries of all sorts are next to an entire failure.

When sending abroad or elsewhere for a supply of desirable trees for the coming season include in the list *Pseudo-larix Kämpferi*. It is much handsomer than

for many shrubs grown in standard form. There is hardly any limit to the varieties of shrubs that can be used, for any of them that makes a stem strong enough to bear a head of shoots and flowers answers, and nearly all sorts do this. Even the snowballs, with their heavy heads of blooms, are found to support themselves well; one of them, the old kind, sterilis, forms a pretty object as a standard, because its heavy heads of flowers cause the branches to bend downward to some extent.

The greater number of shrubs sustain their heads well, especially if they are of strong growth before being started as standards.

The usual plan to make standards is to take a stout shrub and cut it down almost to the ground. Several shoots will arise when growth starts, and of these all should be cut away but the strongest one near the center. Let it grow on to reach a desired height, then top it, that a head may be formed. As the shoots of the head grow, pinch them off at their ends when almost six inches in length. In this way a fairly bushy head may be had in one season.

Snowballs and hydrangeas are in much demand as standards, both making interesting and beautiful objects when in flower.

Nearly all shrubs make stems strong enough to sustain a fair-sized head. Occasionally one may need a stake support for a year or two; and in the case of wistarias and other vines it is always necessary to stake them for

Paeonia Moutan, Tree Peony

any true larch, and its appearance creates a demand for it from all who desire a beautiful tree.

Acer Ginnala has to recommend it its value as a large shrub, its pretty Summer foliage and its handsome orange red leaves of Autumn. It bears a profusion of greenish white flowers in Spring, of no particular beauty, but of a very pleasant odor. Its seeds ripen in late Autumn, and if sown then they grow freely in Spring.

Crataegus cordata, the Washington thorn, is one of the most desirable of all the species. It has pretty green small leaves, it flowers after all other thorns are over, and its clusters of small berries are of a bright scarlet, ripening late.

Choisya ternata, so much praised in English horticultural papers, is not hardy in the Northern States as has been proved many times.

A correspondent speaks of the golden yews losing their golden color, running back to their original green. It is not believed they do this, but simply are less golden in some stages of growth than others—in late Summer and Autumn, for instance.

Standard Shrubs.

With the increased interest displayed by men of wealth in all matters relating to horticulture, those of them who possess large estates, as many of them do, concern themselves in the embellishment of their ground to a far greater extent than they did. In the carrying out of landscape designs trees and shrubs of various characters are required, and this has brought about a demand

two or three years, by which time the stems become stiff enough to be self-supporting.

Paeonia Moutan, Tree Peony.

The varieties of the common herbaceous peonies are so numerous that their list embraces a wide diversity of color, many of them of great beauty, which makes them much sought for.

The tree peony, which our illustration represents, has not been improved so rapidly as the herbaceous one, and there are not nearly as many sorts known. Still, the few there are are beautiful; and then the plant is not herbaceous, but a shrub—a point valued by those who wish a peony in the shrub border.

The original "tree peony" is a single-flowered one, and being a free grower it is valued for this; there are many who think single flowers are still the most desirable. The sorts known vary from the single-flowered ones to those "as double as a rose." The one pictured here is an intermediate sort, not single and yet not nearly as double as many are.

When tree peonies are young and vigorous their flowers are much larger and finer than they are when older. Our representative bush shows this, the flowers being of hut medium size.

Tree peonies are propagated by grafting them on the roots of the perennial sorts, as well as from seeds, when these can be got, which is not difficult when the varieties border on the single type.

JOSEPH MEEHAN.

SEED PANSY SEED

Brown's Extra Select Superb GIANT PRIZE PANSIES

AWARDED Silver Medal, St. Louis Exposition, 1904. It is a well known fact that my superior strain of Pansies is the finest in the market and has won prizes wherever exhibited. Flowers are from three to four inches in diameter; in beauty they are unsurpassable and in color they are incomparable.

My own grown seed, new 1907 crop ready.

Price mixed seed: 3000 seeds, \$1.00; 1-4 oz., \$1.50; 1-2 oz., \$2.50; 1 oz., \$5.00; 1-4 lb., \$14.00; 1-2 lb., \$25.00; 1 lb., \$50.00.

PEONIAS

The best and largest collection in the world!

The largest stock anywhere! 150,000 plants, over 1000 distinct sorts.

The finest display of bloom in America this year—the limit of excellence. Everyone that viewed them admit their magnitude, excellence and the great care to have the best, unmixed and true to name.

We have about every sort known—why should we not have the finest? Our leaders:

Couronne d'Or, Duchesse de Nemours, C. Archard, Festiva Maxima, Marie Lemoine, M. Dupont, Octavie Demay, Whitley, Delicatissima, Dorchester, Eugene Verdier, Floral Treasure, Grandiflora, Jenny Lind, Lady Bramwell, L'Esperance, Mad. Ducl, Modeate, Guerin, M. Bouchariat Alne, Nec Plus Ultra, Perfection, Rosea Superba, Western Beauty, Bacillus, Delasche, Felix Crouse, L'Eclatante, Purpurea Superba, Rubra Superba, Souv. de Aug. Meille, Victor Hugo, Warwick, Officinalis Alba Plena, Alba Mutabilis, Rosea, Rosea Superba, Rubra.

The best of several hundred novelties and rarities:—Lutea (Delavayii), Aug. Villaume, Avalanche, Collath, F. B. Hayes, M. M. Cahuzac, Petit Renee, Mikado, Sapho, Barones Schroeder, Gismonda, Coronation, Pierre Duchartrei, Michelele, Mireille, etc. etc.

Owing to the lateness of blooming and our desire to profit by their blooming our list will be a trifle late. Write for any special sorts desired.

C. BETSCHER, Canal Dover, Ohio, U. S. A.

We have a very fine stock of Iris, Cannas, Gladioli, Dahlias; no one has better stock regardless of claims.

New York.

The Week's News.

July is here and vacations are in order for those fortunate enough to obtain them. Charles Schenck of the firm of Traendly & Schenck, together with Mrs. Schenck, sailed for Europe on Saturday last, and will be gone for five or six weeks.

The wholesale stores, commencing this week, are closing at 4 p. m. daily; this gives all hands an opportunity of spending a long evening at the seashore every day in the week if they so desire.

The auction rooms are closed for the Summer; and the seed houses present a quiet aspect, now that the season is over. Seed sowing time has stretched over a long period this year, and, while owing to the inclement Spring weather, planters have had much trouble, and have no doubt, made several sowings of some crops, from the seedsman's point of view, it must have been an exceedingly good season for business.

S. Groot, of the firm of Slinis & Groot, seed growers, of Holland, left for home on Wednesday, July 3, on the steamer New Amsterdam, after a very successful trip in the United States.

A western newspaper referring to the speech made by Patrick O'Mara, at the banquet given last week to the American Seed Trade Association at the Hotel Astor, says that gentleman caused a stir by announcing that a new fruit is being raised in New Jersey which will be known as the "Millionaire Berry," a strawberry almost as large as the Burbank potato.

If we are to place any stock in the reports circulating in the daily press regarding the economical streak in vogue among the ultra-rich, we may look for a very dull and disappointing season at Newport, R. I. this Summer. One Connecticut paper refers to the present conditions as a rich man's panic and adds "A large number of the fashionables have decided to cut down their expenses in Newport this Summer or cut out Newport altogether for this year." From the foregoing, it is evident that New York will not be called upon to supply many flowers for that resort this season. It was remarked in Twenty-eighth street this week that the trade would depend mostly on funerals for the next two months, when John I. Raynor said "half of the population of the city would have to die twice a week if we have to depend wholly on funeral work for using up the supply."

A. M. Henshaw has moved to his new quarters at 44 West Twenty-eighth street; and Frank S. Hicks & Company are occupying the store at 52 West Twenty-eighth street just vacated by Mr. Henshaw.

Gunther Bros. are progressing rapidly with the improvement and the extension of the store front at their recently occupied premises at 114 West Twenty-eighth street.

E. W. Neubrand, of the F. R. Pierion Company, Tarrytown, N. Y., and H. C. Neubrand, of East Providence, R. I., together with their wives and children, helped their father and mother celebrate their golden wedding, at Webster, N. Y., on Sunday, June 23.

At the Huntington (L. I.) Horticultural and Agricultural Society's rose and strawberry exhibition, held on Thursday, June 27, Walter Jennings was first for pink roses; second for white roses; third for red roses, third for any other color; first for sprays of white moss roses; first for best collection of roses; and third for sweet peas. August Heckscher was second for pink roses; first for white; second for red; first for any other color; first for vase of hardy flowers; second for collection of hardy flowers; first for carnations; and also received a special prize for collection of palms. August Tighs, was third for pink roses. Wm. O'Hara, third for white roses; second for any other color and first for climbing roses. Thos. Caley was awarded second for white moss roses, and first for pink moss roses. James Kirby was third for collection of roses; first for collection of hardy flowers; third for carnations and second for collection of peonies; the first prize for peonies going to H. T. & A. H. Funnell.

A negro, who was hanged at Atlanta, Ga., last week, confessed on the gallows to having, among other crimes, brutally attacked the sisters of Wm. J. Lawrence, who was at one time manager for Chas. A. Dards, retail florist, this city.

A new local of the International Association of Steam, Hot Water and Power Pipe Fitters and Helpers was formed at Kaiser's Hall, Grand street and Communipaw avenues, Jersey City, on Saturday night last, made up of steamfitters and helpers employed in local greenhouse work, and to be known as Local No. 90.

The Evening World in a recent editorial advises New Yorkers to grow vegetables in their backyards, and to teach the children to work in the garden.

The well-known firm of Dailedouze Brothers, Flatbush, N. Y.; was dissolved on July 1 by mutual consent, Paul and Henry retiring therefrom. The concern will be succeeded by Eugene Dailedouze; the firm name will remain unchanged.

Ant. C. Zvolanek, Bound Brook, N. J., has just returned from a trip to California, whither he went to inspect the sweet pea crop.

Washington, D. C.

With the exception of a few weddings, June closed rather uneventfully for the trade. There has been an oversupply on all sides, principally sweet peas, which glutted the market. The carnation season is about over, and growers are removing the last of the old plants from the benches preparatory to refilling, etc. The dull season is on.

Z. D. Blackstone has transformed one of his windows into a miniature lake with canoes, lilies, bark, etc., and a "sure enough" alligator.

Gude Brothers Co. have rearranged their attractive window on F street with a fine aquatic display, an old mill and a Swiss cottage, which daily attracts large numbers of people.

The Washington Florists' Club held its July meeting on the evening of the 2d, at Gude's hall. It was decided to hold a chrysanthemum show November 11, 12, 13, 14, with George Cooke, George Field, and F. H. Kramer as members of the committee. The club decided to give an outing to Great Falls of the Potomac about the third week in July, on which the florists could take their families and have a sociable time, concluding with dinner at the hotel. The occasion is looked forward to with much pleasure.

JAS. L. CARRERY.

Buffalo, N. Y.

Readers who are former residents of Buffalo, N. Y., are asked to send their addresses to the Old Home Week Committee in order to receive souvenir invitations to Old Home Week in Buffalo, which will be from September 1 to 7, inclusive.

NEW BEDFORD, MASS.—The past week saw an improvement in the cut flower trade here, commencements and graduations calling for plenty of good stock. Carnations are now plentiful, selling at 35c. per dozen, retail.

E. H. Chamberlain's lease of the greenhouses of W. G. Kroeber expires this month; he will not renew. The greenhouses are in the hands of creditors.

Wm. Davenport, storeman for H. A. Jahn, took over the business of the store on July 1. Mr. Jahn will continue the greenhouses at Clark's Point.

J. H. Cleary opened his new store last week. He presented a carnation to each lady and a cigar to each gentleman caller; 2,000 carnations and 500 cigars being given away.

Carnation plants are about all set out in the field.

At a special meeting of the Horticultural Society last week it was voted to hold the annual flower show of the society in City Hall on Tuesday, Wednesday and Thursday of Old Home and Textile Carnival Week, provided the general committee will pay the actual expense of holding the exhibition. An exhibit of peonies was made at the meeting by James Garthley and H. A. Jahn.

HORTICO.

MANCHESTER, MASS.—The annual rose show of the North Shore Horticultural Society will, owing to the lateness of the season, be held on July 10-11 on the grounds of the Essex County Club.

At the last meeting of the society James Scott exhibited rhododendrons, anemones, and that beautiful shrub Nanthoceras sorbifolia. James McGregor showed a collection of German and Spanish irises, William Till, lupines, and E. Wetherlow made a fine display of cut gladiolus.

A RECORD BREAKER

GODFREY ASCHMANN of Philadelphia, the
Well-known Araucaria Specialist of America

Watch Us Grow

1907 is now the twelfth year of our anniversary in a successful career in the importation, growing and shipping of that well-known and much admired evergreen decorative plant, the *Araucaria Excelsa*, *Compacta*, *Robusta* and the *Glaucia*. Beginning with the first year (1896) with an importation of 100, this year (Spring 1907) our importation has swollen up to the enormous quantity of 6,000 in the well-known, three best varieties, the *Araucaria Excelsa*, *Compacta*, *Robusta* and the *Glaucia*. Our *Araucarias* are so well introduced that at the present time they represent every city, county and state of America, so far as Cuba and Mexico, and from the Atlantic to the Pacific Ocean. It is always my earnest desire to improve my system in buying, raising, selling and shipping our production to such an extent, that it not only benefits ourselves, but so that it will yield a fair profit into the pockets of our buyers. Now is your chance and the time to fill your empty houses and make money fast, as the plants will grow into money while you sleep.

ARAUCARIA Excelsa, 5 in. pots, 10-12 in. high, 3 tiers, 2 years old, 50c. each; larger sizes, 5-6 1/2 and 6 in. pots, 2-3-4 years old, 60c.-75c.-\$1.00 to \$1.25 each.

ARAUCARIA Compacta Robusta, 6 in. pots, 2-3-4 years old, 10-12-16 to 18 inches high, 3 to 4 tiers, \$1.00-\$1.25-\$1.50-\$1.75 to \$2.00 each.

Cash with order please.

A RECORD TO BE PROUD OF

The Florists' Hall Association has paid 1,040 losses amounting to \$102,000.00
For particulars address

JOHN C. ESLER, Saddle River N. J.

We have beautiful plants of the following choice varieties, grown out-of-doors in rows six inches apart, allowing of sturdy growth. They also have large clumps of roots.

PRICE: \$3.00 per 1000. Except where noted.

Violet King; Vick's Branching White, Pink, Rose, Lavender, Purple; Carlson's Shell Pink, Lavender, Early and Late White; Kate Lock White and Daybreak; Purity; Lavender Gem; Daybreak; Queen of Market White, Light Pink, Rose, Lavender and Purple.

Royal Purple (New), \$5.00 per 1000.

NATHAN SMITH & SON, Adrian, Mich.

Aster Plants Simple Branching and Queen of the Market, fine plants grown from the best seed, \$2.50 per 1000; 5000 for \$10.00.

J. C. SCHMIDT, Bristol, Pa.

THE WEEK'S WORK.

Timme's Timely Teachings.

Useful Stock from Little Pots.

Nowadays local florists and retail growers use up incredible quantities of all sorts of small stock in the filling of baskets, pans and fern dishes—forms of indoor plant adornment constantly gaining in favor. There is much call for arrangements of this kind from early Autumn until the end of Winter, the demand being greatest at Christmas and New Year, and still brisk enough at Easter to cause scarcity of suitable material on many places. To make provisions for an ample and ever-ready supply in stock of description fitting the purpose and insuring small initial cost, should at this season be one of the first things to be attended to in the retail grower's manifold preparations for a coming year's business.

Foremost in point of all-around utility are doubtless small ferns. They may be had at all times of the year by the thousands at moderate cost, and when it is possible—as is usually the case at this season—to obtain flats of small seedlings, once transplanted, the first outlay in cash is reduced to a minimum and the little ferns, with anything like ordinary good care, can be grown into just the right kind of stock for the purpose in view with no trace of difficulty. In transferring the ferns from the trays to pots the smallest possible sizes, say 2 or 2 1/2 inch standard pots, should be used and a good, porous kind of potting soil. Several of the smallest seedlings may be bunched and put into one pot, thus obtaining serviceable, densely leaved tufts in a short time. In these bright and sunny days it is necessary to take good care of the newly potted ferns, to keep them sprightly green by frequent spraying and by having them well shaded in daytime for at least a week when there will be less need of shading during the greater part of a sunny day.

Among seedling ferns, potted up singly from flats, there is a great difference—not merely as regards species and variety in mixed lots, but also in vigor and speed in growth, so that some of them in these particulars and often in graceful form and depth of coloring are far ahead of others of their kind. Such plants, too good to serve as filling material, deserve special attention and may with a couple of timely shiftings, plenty of room and good care, be grown into fine 5 or 6-inch specimens, a kind of stock always finding buyers and not at all out of date Boston ferns or not. A good collection of ferns other than the various kinds of nephrolepis are more of an attraction now than they ever were before, a fact many of the smaller class of plant growers were not slow in discovering.

While Boston ferns, now under bench culture, will soon send out a multitude of strong side runners, it is well to take off these from time to time, to pot them up and to separate the young stock into graded lots. These runners, after being potted up, need somewhat more care and closer attention to secure a good start than do the seedling ferns of such species as *davallia*, *aspidium*, *pteris*, *lastrea*, *polypodium* and others.

Other foliage plants of value in the filling of plain or fanciful receptacles are palms—small *cocos* in particular—crotons, dracaenas and many others, usually most needed after the last of serviceable plants is gone. It is now a good time to provide against future scarcity. This sort of stock as well as small ferns, can be obtained cheaper by ordering in good season from growers who have made mass cultures in these lines their specialty than by attempting to raise them in a small way in houses seldom adequately equipped for such work. Still there are so many things to be found among the home grown stock of the retail florist, eminently fitted for this line of trade, if coming out of pots not larger than the 3-inch of the standard or shallow brand, that could easily be had in sufficient quantities at almost any season of the year. Such are *Asparagus plumosus* and *A. Sprengeri*, bulbous flowers, primulas, flowering plants of many kinds and anything propagated late and of dwarfish growth.

Poinsettias.

Next to *Begonia Gloire de Lorraine* we have found the poinsettia the most attractive of plants to be had in fine form

for made-up Christmas pieces. Though naturally a plant of rather tall and slender growth it can be had in just the right size for massing in shallow pans or for being used in effective plant combinations. But right size alone, even if brought down to six or eight inches, is not enough to render poinsettias suitable for the purpose. Unless they show up well, are short-jointed, stocky plants with ample foliage of a deep, spotless green, crowned by bracts of brightest hue, not necessarily large, and their roots not torn or in any way mutilated in coming out of the pots, they had better be rejected in the making-up of high-class work. This the finest of Winter-flowering plants, when rightly managed, is also the most unsightly of failures in plant culture and certainly the most unsatisfactory of house plants when poorly grown or carelessly handled. People have learned to accurately judge their value, and while a stock of well done poinsettias is still good property, anything defective in bract or foliage, betraying the least traces of mealy bug or indicative of short-lived beauty, is soon detected by the experienced holiday shopper, and large amounts of stock in poinsettias, potted specimens as well as made-up pieces, but especially of that offered in a cut state, remained unsold the last year or two and went to waste, not so much owing to overproduction as to practically unsalable condition when offered.

Small poinsettias, grouped within a fringe of ferns in pans or fancy dishes, still are in high favor and when offered and sold in that form prove quite profitable stock worthy to be grown in considerable quantities. To induce a limited number of old stock plants to produce cuttings in sufficiency for this sort of stock it becomes necessary to cut back the new growth from the time the old plants were fairly started until about now, always leaving a number of good eyes on the somewhat hardened wood for successive breaks. In taking cuttings for early propagation, taking them off above a couple of eyes, we also obtain a later crop of cuttings, but never enough, unless we can draw from a considerable number of stock plants. In cutting back with the object to increase the amount of material for late propagation to the fullest extent one cannot wait until the shoots to be cut off are of sufficient strength for being rooted. But early made cuttings, now fast growing plants, can by being stopped once or twice be made to contribute to the number of cuttings to be rooted late. The old stock plants, put into fresh earth when started some eight or ten weeks ago, will now need feeding, to encourage rapid and sturdy growth, and for the same reason we let them have plenty of room, water, air and light.

From the middle of July until nearly the middle of September poinsettia cuttings will root readily with probably a small percentage of loss among the latest batches. They may be rooted in a layer of pure sand, allowing sufficient room between plants, or be at once put into small pots in light, sandy soil, these set closely together, not plunged, on some shaded bench in a house not too close or stuffy. Enough in the way of sprinkling and watering will prevent wilting. Those in the sand bed must be potted up before the roots reach the length of half an inch. Then shaded for a few days they will soon be in condition to stand the full sunlight and the greatest amount of ventilation, essentials in the raising of dwarf poinsettias during the latter part of the warm season.

The best kind of a cutting in propagating for this particular class of stock is a perfectly formed shoot of about 2 or 2 1/2 inches in length, stout and chubby, cut closely below a node or eye or torn off with somewhat of a heel to it. Trimmed of one or two of its lowest leaves and dropped into water until the bleeding has stopped, it is ready for the propagating bench. The great loss in rooted and unrooted cuttings in the late propagation of poinsettias, as experienced here and there, is owing to various causes. A cutting taken when yet too soft will rot; so will every one cut at an internode, leaving a piece of hollow stem at the end. A rooted cutting, remaining in the sand too long and not given the best of care after being potted up, usually dies back or amounts to little.

Freesias.

Among the earliest arrivals in bulbs are freesias, California and Bermuda grown corms, well ripened and ready for being planted and started into immediate growth are to be had as early as the first

week in July and in some seasons much sooner.

An early start means much in bringing success with freesias; it is one of the details in their culture most worthy of being held in mind and most often overlooked. When freesias are on a grower's program for the coming season it is well to order early and to plant as soon as ever possible when the bulbs are at hand.

Freesias admit of being grown in various ways. Several bulbs planted together in a pot, slowly started, placed near the glass and kept in good trim by staking and tying, present a fine appearance when in bloom and are by no means the least profitable among potted plants. Many corms, closely planted in trays or boxes, pans or dishes, not too shallow, can be grown into desirable objects for greenhouse trade or conservatory display, or made to produce blooms for cutting. The growing of freesias in clumps and widely separated clusters in and among the rows of beehive sweet peas, carnations and other crops is a way least worthy of commendation and but rarely practiced by good, thorough-going growers.

To be raised with profit as a cut-flower crop in a small way for either market or home demand, freesias will give satisfaction when planted and bloomed in boxes of a size which permits of their being moved about with ease, placed on shelves or any part of a bench believed to be a good place for them.

Bench culture, in preference to all other methods, gives undoubtedly the best results in all attempts at making freesias a venture of some consequence. The bench to be chosen for the purpose should be well up to the light and the house should be one easily kept at from 45 to 55 degrees in Midwinter. Grown in a temperature lower than this the crop will not be ready to cut before some time in early Spring, and ripening of the corms, always good for succeeding seasons, will also be delayed considerably. But when the house can steadily be held at a temperature as is required in the forcing of roses, freesias will bloom in the depth of Winter, but can, in no case, be depended upon to bring marketable flowers as early as Christmas—a point worth bearing in mind. Early planting, as advised, imparts and upholds vigor in the corm, prevents loss of vitality by prolonged dormancy, but must not be looked upon as a means of securing an early crop of flowers. Temperature alone is influential in hastening on a crop of blooms on freesias.

Freesia bulbs can be planted quite close in the bench, either in rows five or six inches apart with about two inches of space between the bulbs in the rows, or in hills, six or eight bulbs clustered together, the hills about eight inches apart each way, a plan which makes the picking of flowers more easy should the bench be of considerable width. The top of the corm, after being pressed into the soil in planting, should not be much less than an inch below the surface line of the soil, this to be the kind of compost as used for roses with a liberal admixture of sand or powdered old plaster from the walls of torn down buildings, an article invaluable but not always easy to get. Freesias must be kept well watered from the time they are planted until the end of their flowering season.

Reminders.

Old plants of Begonia Gloire de Lorraine now furnish cuttings that root easily and which with ordinary care can be grown into stock of a kind much needed next Winter and serviceable where larger specimens could not be used.

Small hydrangeas, plunged in frames, soon grow into marketable size if shifted in time and never allowed to suffer for the want of sufficient room or water. Those in the field will make a sturdier and more compact growth if not watered too frequently. The stopping or shortening in of flowering wood must now be discontinued.

The planting of smilax should now be finished or be well under way, and should be closely followed by the stringing of the bed, work never lightened by delay.

Violets in the field need attention. The ground must be kept loose and porous to a depth of several inches about the plants, and these will make sturdier crowns if constant removal of runners is not neglected.

It is well to make another sowing of Gypsophila elegans, candytuft, mignonette, schizanthus and sweet peas for a

RUTHERFORD, N. J.

THE AMERICAN PEONY SOCIETY

Successful Meeting at Cornell University, Ithaca, N. Y., June 27 and 28, 1907.

Old Board of Officers Re-elected.

The Society Goes to Cornell Next Year Again.

The fourth annual meeting of the American Peony Society was held at Cornell University, Ithaca, N. Y., Thursday and Friday, June 27-28, 1907, and was a record-breaker in point of attendance and enthusiasm, over forty persons being present at almost all of the sessions during the two days. The magnet which drew the delegates to the meeting place was primarily the peony tests as conducted there by J. Eliot Coit under the supervision of Professor John Craig in charge of the horticultural department of Cornell. Professor Craig and his assistants were untiring in their efforts to make the gathering both pleasant and profitable to the visitors.

The exhibition was somewhat disappointing. It had been expected that several of the peony growers in the vicinity of Cornell would contribute to the display, but the season had been such an erratic one that most of the flowers were passed before the date of the show. Ellwanger & Barry, Rochester, N. Y., sent three fine vases, and President Ward took with him from the Cottage Gardens, Queens, N. Y., some 1,000 blooms, comprising a large number of varieties, and these made a grand display of themselves. George Hollis, South Weymouth, Mass., sent several seedlings, but the flowers did not carry well. There was also a large exhibit from the test garden of the College of Agriculture.

rowest sense; not merely field crops, but all those things which have to do with the open country, with the raising of products from the land and the social and economic questions which arise therefrom. "We are trying," Dr. Bailey said, "to use the information from the fields and their environments for the training of men's minds." The students can do what they please after they leave the college, but as a matter of fact the majority of them enter agricultural pursuits. The college was really covering more fields than it ought to do with the money at its disposal. The last legislature appropriated \$150,000 a year for the maintenance of the College of Agriculture; \$50,000 for the equipment of buildings. The buildings cost about \$300,000 and are not yet completed; \$25,000 have also been appropriated for barns.

The greenhouses in connection with the institution are, Dr. Bailey said, such as no commercial florist would have on his place. It is not so long ago when the idea prevailed that a College of Agriculture did not need greenhouses except for show. The speaker stated that it was hoped before long to secure money from the State to build a new range of greenhouses near the college building to put that phase of the work on its feet. The college has also classes devoted to nature study and to landscape gardening.

cost of his own time and that of his wife and children, who are often employed in greenhouse work with him; nor does he take into consideration the wear and tear of his plant. Businesses conducted on these lines are being run at a loss, but in the case of those situated near large cities, this loss is partly offset by the advancing land values, in which way such florists have made their money, and not in their business.

One of the essential objects of associations like the American Peony Society should be to instill a certain amount of business methods into the minds of those engaged in the industries which these societies represent. One of the first things that a business man has to learn is to sell his products at a profit, and in this respect there is no difference between a man who grows carnations and a manufacturer. There are too many in both the florist and nursery business who are giving their goods away. Under present conditions, Mr. Ward said, it was impossible for a peony grower to sell his plants at a profit, owing to the fact that it was not possible to dispose of the stock of any variety in quantity. What the peony grower must do is to get a list of varieties that one can buy in quantity. The check list recently compiled by Mr. Coit and distributed by the State College of Agriculture shows some 3000 names; 100 or 150 varieties are all that are needed to do business with satisfactorily. It is not a commercial possibility for a man to carry 400 or 500 different varieties of peonies and do business with them; if he attempts it he gets mixed up. A list of fifty or at the most 100 sorts would be a large enough working list, and before peony growers can clear themselves of the charge of loose business methods, they must get something of that kind.

Another matter to which the grower must give attention is to build up a love for the flowers, and this can be done by exhibitions. Mr. Ward said he had made up his mind to give an exhibition of peonies at his grounds for about three weeks every year, and recommended all other growers having the facilities to do the same.

Referring to the work at Cornell in the matter of straightening out the peony nomenclature, the president suggested that the present committee be added to for the better carrying out of the work. A suggestion had, he said, been made that the society meet at Cornell next year again. This might be a wise thing to do—in fact, for two or three years—as much help could be given by the members toward the end desired.

The minutes of the last meeting were read by Secretary Fewkes and adopted.

Election of Judges.

The following gentlemen were elected judges of the exhibition: Messrs. George E. Thurlow, J. H. Humphreys and E. H. George.

Secretary's Report.

The secretary then read his report as follows:

The present membership of the society is forty-three, not including two honorary members.

During the year we have lost one member by death. Mr. F. A. Blake of Rochdale, Mass., who passed away on July 1, 1906. He was a charter member of the society and in his death we have lost a most valuable member. He was an enthusiastic horticulturist, taking great interest in the peony and the success of our society, but was too unassuming to appear in any prominent way. It was through his efforts that the list of Japanese peonies was secured, he being an intimate friend of a young Japanese of high standing in the government of his country, and who was prevailed upon to secure an authentic list of such varieties as were known to exist there.

In regard to the fungous disease mentioned in my last report we were informed that it had been pronounced by Professor Whetzel to be *Botrytis vulgaris*, or the common brown mold, and only a temporary affection dependent upon weather conditions. While the latter may be true in a measure, it is nevertheless a most troublesome disease in many places, particularly in old gardens, and I have known instances where nearly all of the stalks of large plants have been swept away by it. We were told at the last meeting that a change of location is a remedy for this trouble. Undoubtedly this is a great help but not wholly effective, as I found the present season the disease had followed some of my plants which were moved into new ground last Fall.

It seems to me the society should take up the study of the diseases of the peony and not only determine their nature but find effective ways of preventing them, for it is a vital matter, particularly with the amateur whose garden room is usually limited and is constantly in use so that he is unable to run away from diseases but must find some means whereby he can fight them on the spot.

Another matter of importance is the registration of new varieties; and some systematic method of recognizing new varieties of more than ordinary merit. Registration would naturally fall to the care of the Nom-

The Vases of Fifty Flowers
Exhibition of American Peony Society

The exhibition was held in the auditorium of the State College of Agriculture, the meetings in the lecture room of the horticultural department.

Thursday Afternoon Session.

The first session opened at 3.30 o'clock Thursday afternoon, President C. W. Ward in the chair. Mr. Ward introduced Dean Bailey, who gave a most interesting talk on the aims and objects of the State College of Agriculture at Cornell. He was glad, he said, to welcome the members of the American Peony Society because the college recognized agriculture in its broadest sense, which included horticulture and floriculture and every other industry by which those engaged therein drew their living directly from the soil. That was why the college was interested in the peony. About four years ago the State appropriated \$250,000 for the erection of the State College of Agriculture, which is now one of the eight integral parts of the Cornell University. The course at the College of Agriculture does not include agriculture in its nar-

The number of persons on the staff of the College of Agriculture is about 70; the pay roll about \$100,000 per year; the number of students about 542, and there is no reason why it should not be 1,000. "Every one engaged in floriculture," said Dr. Bailey, "should be interested in a college of this kind." (Applause.)

President Ward had prepared no address, but spoke ex tempore. He said he felt very thankful to Professor Bailey who had opened their eyes as to the nature of the work being conducted at the State College of Agriculture. He himself was born on a farm, and as he grew up his particular work was at the tail end of the thrasher.

Since entering the florist business he had been struck with the lack of business methods generally among those engaged in it, especially the lack of knowledge concerning the cost of production—a matter which first of all was studied by the men of every other line of industry. Growers are practically selling certain classes of products below the cost of production. The florist, as a rule, does not include among his expenditures the

enclature Committee and I suggest that steps be taken to establish this.

Recognition of superiority of new varieties is a more complex matter and needs careful thought before any system is decided upon.

Another matter which seems to come within the jurisdiction of this society is the branding of dishonest dealers in peonies. Some means should be found whereby these unprincipled frauds can be driven out of the business. We are all liable to make mistakes and we all feel charitable toward the one who makes them honestly; but he who makes them dishonestly should be dealt with, with a heavy hand by this society, when detected.

The exhibition in connection with the meeting at Boston last year was a grand success; the number and general quality of the flowers shown were considerably in excess of the Chicago show of 1905. The exhibits in competition for the prizes offered by the Peony Society were not numerous, but combined with the exhibits of the Massachusetts Horticultural Society they made a magnificent show, excelling any previous exhibition of the flower in this country. The only exhibitors from a distance were Messrs. C. W. Ward, Queens, N. Y.; C. W. Hoit, Nashua, N. H., and E. A. Reeves, Cleveland, O. Although losing the greater part of his flowers from storage in ordinary ice cold refrigerators, Mr. Ward made a very creditable display. Out of about eight hundred blooms sent to Boston for storage only one hundred and fifty were fit for exhibition.

The success of the exhibition was due principally to the fact of its being held at a peony center, and the local growers felt it incumbent upon them to keep up Boston's reputation for exhibits of this flower.

The lunch provided by the Boston Gardeners and Florists' Club on the afternoon of the first day was a pleasant affair and was much appreciated by all. Remarks were made by President C. W. Ward, C. S. Harrison, E. A. Reeves and Wm. C. Barry, James Wheeler, president of the Boston Gardeners and Florists' Club, presided and welcomed the society to Boston.

A. H. FEWKES.

On motion of Professor Craig a committee was appointed to consider the points brought out in the secretary's report. That committee consisted of Professor Craig, Messrs. J. H. Humphreys and E. B. George.

George B. Peterson, Fairlawn, N. J., expressed his opinion on the need of cognizance being taken by the society of new varieties introduced into commerce, stating how easy it was to send out a new peony only slightly different from those already on the market, and citing the case of Golden Harvest which, he asserted, was identical with Jeanne D'Arc. The former was said to be a seedling, but its close resemblance to the latter was sufficient, in the speaker's opinion, to debar it from being introduced into commerce. He suggested that new sorts be exhibited at the annual meeting before being introduced, for the approval or otherwise of the association.

Mr. Ward said that Mr. Peterson was entirely mistaken as to Golden Harvest being the same variety as Jeanne D'Arc. They are very distinct, just as the last named is distinct from other peonies of its class. Golden Harvest blooms at a different season; and its habit is dwarfer than that of Jeanne D'Arc, which is a tall, erect grower; the color of the two varieties may appear similar, but they are distinct.

Mr. Peterson said he had the two varieties growing side by side and could detect no difference between them. He had received Golden Harvest from the originator and Jeanne D'Arc from France.

Mr. Ward considered Golden Harvest one of the best peonies for bedding. Some of the varieties in the tricolor section come in early and some very late. If it was possible to bloom them altogether it would be a difficult matter to tell which was which and while the flowers on the exhibition table may appear similar, the plants themselves are distinct in habit, time of blooming and in other characteristics.

Mr. Peterson asked the difference in the time of flowering of the two varieties he had mentioned.

Mr. Ward: Two days and sometimes more.

Mr. Peterson said he had never noticed any difference. He also considered Floral Treasure and Delicatisma identical.

At this point Professor Craig suggested the postponement of the discussion until the committee on secretary's report had brought in its report.

Treasurer's Report.

The report of Treasurer Humphreys showed a balance on hand in favor of the organization of \$510.83. Messrs. E. B. Hodges and A. H. Fewkes were appointed a committee to audit the treasurer's books.

A Visit to the Peony Field.

At this stage of the proceedings Professor Craig announced that carriages were in waiting to convey the delegates to the peony field which is located about 1 1/4 miles from the college. This proved a most enjoyable

feature, and the great interest shown by the visitors was clearly manifest. The plants had been set out under number, and Mr. Coit had prepared an identification list giving the name, originator and full description of the varieties obtainable. It was evident that many of the varieties had been disseminated under different names, as a grower would designate a particular sort as being so and so, only to find on reference to the list that the name was entirely different from that under which he knew and was selling the variety. Numerous notes were made of the best kinds then in bloom, as well as for the purpose of getting at the correct nomenclature. A very profitable hour or two was spent in this way. A group portrait of the visitors was taken here by Mr. Coit, and is reproduced in this issue.

A Pleasant Occasion.

On Thursday evening the members were the guests of Professor and Mrs. Craig at their home, when an informal talk on peony matters generally was indulged in, and those present enjoyed the hospitality of Mr. and Mrs. Craig. In the course of conversation Professor Craig mentioned that it might be a good idea to hold next year's exhibition on the peony grounds under a tent, and was of the opinion that this plan might be carried out. Other subjects touched upon by the mem-

Mr. Ward said that while the amateur might at first get a few of the odd things, he tired of them in time. It might, however, be all right to keep some of the latter sorts; but when you come down to peonies that are to stand, the commercial kinds so-called, are what are wanted. The plan he had proposed would bring out the consensus of opinion of the peony men throughout the country, who are studying the plants from the commercial standpoint and would furnish a good working list.

In regard to the introduction of new varieties, Mr. Ward said he had grown peonies from seed, and he considered it impossible to get new sorts better than those already in commerce. He thought the work of growing new peonies from seed a waste of time, labor and material. If growers practicing this would put the time expended on growing seedlings into raising a collection of the most valuable kinds, they would find it more profitable. In the case of receiving a new variety of merit from, say, China or Japan, it might be possible to produce from it something worth while, but there was nothing to be obtained by rushing a new variety into commerce because it had supposed superiority when compared with the trash already on the market. The work must be gone about in a deliberate, systematic manner.

THE AMERICAN PEONY SOCIETY

bers was that of mulching, for which purpose cut straw and meadow muck were spoken of as suitable materials. Cowpeas plowed in as a previous crop for fertilizing purposes for the peony patch was recommended. This session terminated at about 10.30, and will be an occasion long remembered by all who participated therein.

Friday's Sessions.

Friday morning session commenced at 10.30, President Ward in the chair. In opening the proceedings Mr. Ward said, with the view of getting a working list of say 100 or 150 varieties of valuable peonies correct as to name, it had suggested itself to him that those of the members who had large collections of peonies from which to select varieties that are considered valuable, should send a record of these kinds with a good, strong plant of each to the university, and have a new plot started, these plants to be set out in batches, according to the name given by each grower. From these plants it would be possible to get, from the 300 or 600 varieties that would be thus supplied, 150 kinds that everybody might grow. This would furnish material that all could work upon as a beginning.

Mr. Ward then gave an instructive demonstration, by flowers, of varieties that he considered good, doubtful and worthless kinds, explaining his reasons for the assignment of the sorts to the different classifications. This was one of the most edifying features of the meeting.

Professor Craig called attention to the fact that perhaps the amateur might view the varieties from a standpoint different to that of the commercial grower.

It was finally decided that the suggestion of the president be acted upon, and that each grower send a three-year-old plant of every variety he is cultivating to the college grounds for comparison and study.

A Talk on Nomenclature.

Professor Craig gave an exceedingly interesting talk on the subject of nomenclature, pointing out the importance of this phase of the peony grower's work. Touching upon the history of plant nomenclature, Professor Craig said that about 100 years ago there was no system of nomenclature. While plants were not named as we know them now, they were described in Latin, the description being taken from the characteristics of the plant. That system has not entirely gone out of vogue, being still used in the case of some things, as for instance: radishes, turnips, etc. Then came the binomial system of Linnaeus where the generic and specific names were given. The horticulturist next comes along and makes a finer division, giving the variety together with the species and genus. The system of Linnaeus was a step in the right direction, but it made no provision for correcting mistakes; he in Sweden might give a certain name, while another botanist in England might give another name to the same plant.

A code of nomenclature was devised and offered to a committee in 1813. This was suggested by DeCandolle. This code stood until 1842, when the British Association for the Advancement of Science in Europe proposed a modification of DeCandolle's system, called the Stricklandian code, which stood until 1867, when a body of botanists came together and remodified that code, which was called the Paris code. This brought nomen-

clature into the field of botany. None of the English botanists had so far participated in the revision; it was all French. Rules were at that time adopted, and they are essentially the rules we have to-day.

In 1892 the American Association for the Advancement of Science took that code and made some slight modifications upon it adopting it as their standard. This was again modified the following year at a meeting held at Madison, Wis., and that code stood until last year when the botanists again met in Vienna for the purpose of suggesting varietal names and giving them a standing. There are now in botanical nomenclature 200,000 species recognized and 700,000 names for that same number of plants.

Horticulturists and pomologists of this country took up the nomenclature question in 1869 at a meeting, at which the late Patrick Barry of Rochester, N. Y., was chairman. In 1883 a revision of that code was made and adopted by the American Pomological Society which stands to-day, and every plant grower should observe the rules laid down therein in the matter of naming varieties.

The first and most important rule is, that no two varieties of the same kind of plant shall bear the same name, and that the name for the variety first published shall be accepted and recognized.

Now, what is meant by publication? Not merely that the name shall be published, but that a description that will enable one to identify that variety shall be associ-

Professor Craig heartily endorsed the suggestion of President Ward that each grower send to the college a plant each of what he considers his standard varieties. In this way results could be reached much quicker, each man's plants being carefully studied.

In speaking of the work already done at Cornell with peonies, Professor Craig said it had not been carried out as extensively as he would like, because of money limitations. The plants had not been fertilized as heavily as growers would do, as fertilizers cost money. Still, the work had been successful so far under these trying circumstances. He referred to the good work accomplished by Mr. Coit, who he said was to leave the college, but the work would be continued by another student until, he hoped, it could be brought to a conclusion. He then invited the members to visit the library and inspect the literature which had been consulted in the peony studies so far. This was a very interesting visit, which was greatly enjoyed by those present. Professor Austin, librarian, being very courteous and attentive in showing the various volumes.

On the suggestion of the president, Mr. Humphreys moved and it was unanimously decided that the society appropriate \$200 to the College of Agriculture, to be expended by Professor Craig in any manner he sees fit in furthering the work on the peony.

Report of Committee on Secretary's Report.

The report of the committee on the points brought

varieties be of three kinds: Those recognizing merit; those specifying superior merit; and those specifying highest merit. Also that these certificates bear the seal of the society.

Fraud in Naming Varieties—We desire to place ourselves on record as condemning strongly habits of carelessness or fraud in handling and naming or renaming of varieties which result in unnecessary confusion and duplication. We would further recommend that where any case of unquestionable fraud in the naming or renaming of varieties comes before this society that the perpetrator thereof shall be debarred from membership.

Mr. Coit then read the following paper, which was intently listened to. The speaker strongly advised the adoption by the society of the color chart of the French Chrysanthemum Society recommended in his paper, copies of which chart can be obtained from Gustav Stechert, bookseller, New York City. The society voted to use this chart as its color standard in describing peonies.

Address of J. Eliot Coit.

Mr. Coit has been in Direct Charge of the Peony Investigations at Cornell University.

Up to the middle of the nineteenth century the only peony which was known to any extent in America was the old double red of our grandmothers' gardens. It was comparatively common throughout the extent of the Atlantic seaboard, and its large vivid red blossoms with their disagreeable soapy odor were familiar to every one. Even to the present day this flower comes into the mind of perhaps the average American when the peony is mentioned. For various reasons this old peony was looked upon as a vulgar, indelicate and unrefined flower, and while it was tolerated in the yards of the common people, it was rarely if ever given a prominent place in the collections of wealthy and discriminating flower lovers.

However, a great change in sentiment was destined to take place, and this was brought about by the introduction of the species *Paeonia albiflora*, popularly known as Chinese or chinensis peonies. This species bore single white flowers with many buds upon a single stalk. Under the stress of cultivation by the Chinese and later by M. Lemoine, Victor Verdier, M. Guerin and others of France, it sported into many shades of red and all degrees of doubleness. It possessed all the beauty of the old officialis type and also combined fragrance with great hardiness. I consider the species *albiflora*, therefore, as responsible for the great wave of popularity which the peony has undergone, and as evidence I offer the fact that the vast majority of the popular varieties on the American market to-day belong to this species or contain a large share of *albiflora* blood.

Peony History.

The history of the peony previous to 1650 should be treated in two parts, for before that date the peony of the Greek and Latin literature was the *Paeonia officinalis* which is wild in Southern Europe. The ancient history of *P. montana* and *P. albiflora*, however, lies entirely in China and Japan, as previous to 1656 neither of these species was known to Europeans.

It is the species *P. officinalis* which probably secured for the genus its name. The genus *Paeonia* was so named by the ancients in honor of Paeon, a physician, who cured the wounds received by heathen gods during the Trojan war. Antiquity celebrates the virtues of this plant and places it among the wonders of the vegetable creation. Fable gives us its origin. Esculapius its properties, and superstition rakes it among miraculous plants, assuring us that demons will fly the spot where it is planted, and that even a small piece of root worn around the neck is sufficient to protect the wearer from all kinds of enchantment.

The Tree Peony.

In A. D. 536, the Chinese in a general way distinguished two kinds of peonies: The Sho Yo or common kind which we know as *P. albiflora*; and the Mew Tang (Mow Tan) or improved kind which we recognize as *P. montana*. In their flower gardens, the mountans claimed first place in point of beauty, and the Sho Yos took second place. For this reason the former were often called *Ilwa Wang*, "King of Flowers," and the latter *Ilwa Seang*, "The King's Ministers." I am indebted to an ancient Chinese horticulturist, Hung King, who wrote in 536 A. D., for the information that the original native home of the tree peony is the valley of Pa Keun, in the district of Hang Chung, in the easterly part of the province of See Chuen, together with the neighboring south part of Shen Se, or the country about the two rivers Kea Lin Keang and Han Keang. In 656 A. D., Soo King, another writer, announces Hang Chung as the native home of the tree peony, thus corroborating the account of Hung King in 536. I go into this matter thus fully because it has been repeatedly stated in print that the feral home of the tree peony is not known. Robert Fortune himself states in 1880 that the tree peony may be found on the mountains of the central provinces of China.

General View

Exhibition of American Peony Society at Cornell University

ed with that name. As a matter of fact, publication ought to bear a date in order to establish priority. There are a good many catalogues, for instance, that do not bear any date at all. Publication must give a description of the variety associated with the name, and in some standard periodical or catalogue bearing a date.

The form of naming is an important matter. Many of the French catalogues appear like family genealogies requiring an expert to disentangle them. Give a name that is simple and short, and if it describes the characteristics of the plant, so much the better.

Supposing we start with one name, and then find that there are two varieties under it. Trace the names back and get to a point where we clearly see that one variety was described in advance of the other, but if the variety which bears the same name is a good one, it would be a wrong use of nomenclature to say that the poor variety was the one which should be held, and start out afresh; or to say that the worthy variety originated and named about the same time and bearing that date should be put out under another name. This does not strictly carry out the rules of nomenclature, but it carries out the principle of common sense and common usage.

In working out this nomenclature question at Cornell, Professor Craig stated that it would be more than likely that some one was to be hurt, but those in charge would use their best judgment and endeavor to injure nobody.

out in the secretary's report was read by Professor Craig as under, which was adopted.

Plant Diseases—Your committee recommends that a special committee on plant diseases be organized. We recommend that this work be associated with the trial studies at Cornell, and we would recommend that the plant pathologist of the Cornell University Experiment Station, Professor H. H. Whetzel, be chairman of that committee. We also suggest that all members of this society having diseased plants or coming in contact with parasitic troubles, should refer these with samples of plant material to the chairman of the committee on diseases of the peony.

Committee on New Varieties—1. Your committee recommends that proposed names for new varieties shall be submitted to the committee on nomenclature for the purpose of avoiding duplication.

2. We would recommend the appointment of a committee on new varieties. The duty of this committee shall be to pass upon the merits of varieties whose names have been accepted by the committee on nomenclature and which have been tested in the Cornell trial grounds and exhibited at the annual exhibition of the association.

3. Your committee recommends that reports on new

An old Chinese book on the "Origin of Matters and Objects" states that by 713 the number of kinds had so greatly increased that the plant was common about the huts of the poor as well as about the mansions of the rich. Soon after this, about 720, eleven hundred and eighty-seven years ago, the number of kinds had so greatly increased that Gow Yang Sew established a genealogical register in which to record the characters, qualities, and parentage of the kind which came from seed. So we find that our efforts to establish a register for our varieties of peonies are by no means original, but we must take off our hats to our friend, Mr. Gow Yang Sew, whose efforts along this line antedated ours by 1187 years.

In 1656 the Dutch East India Company sent an embassy to China which secured free access to that country, and in the published accounts of this embassy the peonies were described in glowing colors. To make a long story short, Sir Joseph Banks of England became interested in these accounts and after various unsuccessful attempts succeeded in 1794 in introducing into England two living tree peonies. Progeny of these plants were later introduced into France, and Mons. Nosiette, a nurseryman of Paris, distributed them throughout the country.

Albiflora History.

The early history of albiflora is very similar to that of the moutan except that it was indigenous to a very wide range of territory in Northern China and Siberia. As far as I have been able to find, the variety fragrans was the first albiflora to find its way into Europe, and it was brought from China by Sir Joseph Banks in 1805.

Peonies of various kinds were introduced from China into Japan in 724 A. D., and were subsequently greatly improved by the Japanese. Peonies were first introduced into America by William Prince of Flushing, Long Island, soon after they reached England. McMahon speaks of them in 1806, and in 1824 Mr. Prince had a collection of over forty varieties. Some twenty other species have been introduced at various times during the past century, but they are of minor importance. Only one species (P. Brownii) is native of America, and that we find in California. It is of value solely as a botanical curiosity.

Botany.

I have not attempted to work out the botany of the peony for two reasons. In the first place, three or four monographs of the genus have already been published and in the second place, the type specimens of the species are all in European herbaria and it would be useless for me to attempt a botanical monograph without making an extended trip to Europe.

Evolution.

Certain it is that the magnificent large fragrant blooms which appear upon our tables to-day are very unlike their wild prototypes which were introduced from Siberia. How has this vast improvement come about? What agencies have here been at work? How are we to proceed to still further develop this wonderful flower? These are all pertinent questions, but their answers are not difficult to find.

There are three chief causes of variation in plants. They are: Change in environment, change in food supply, and intercrossing. Now the genus *Paonia*, together with its relatives, is naturally variable in a wild state. In addition to this, all three of these chief causes of variation came into active play when the peony was removed to Europe, where a totally different climate prevailed, and they were heavily manured by the French growers, and all of the species obtainable were planted together in botanic gardens and amateur collections where they had every opportunity for inter-pollination. Many of the early growers cross-pollinated by hand to insure the production of hybrids. Even hybrids between the tree peony and the herbaceous sorts were secured. Small wonder then that the new generations presented striking and valuable variations which were selected as parents for succeeding generations. Not only did the peony vary in color, size and odor, but most important of all, it varied greatly in form; and as a result, we have seedlings representing all stages of transformation from the simple single to the fully double. I find after a careful study of the literature that a great deal of confusion exists in regard to the names given to these horticultural types. Especially is this true in regard to the terms anemone and artichoke. For the sake of uniformity and a better understanding of each other's descriptions, I am therefore prepared to propose and define six horticultural types. I think these six types will fully cover the field and will be found to apply to all blooms existing at the time. These types are not ill advisedly put forward. They have gradually grown and crystallized in my mind during a two years' study of the subject. For the terms employed I am chiefly indebted to our worthy president, Mr. C. W. Ward.

Type I, The Single—This type includes all peonies with a single row of petals, enclosing a mass of pollen-bearing stamens, and normal follicles. For the sake of an example, I mention *La Fiancée*.

Type II, The Japanese—When a peony begins to double under the growth pressure brought about by an excess of food, it may do it in two ways. It may present in the same flower stamens or carpels in all stages of transformation, or it may uniformly widen the filaments of all the stamens simultaneously. As a result of this second method, we get the true Japanese type. It possesses the petals of the single with all of its stamens uniformly widened into strap-like petaloides with anthers distorted in various ways. It usually has normal carpels. Many writers seem to hold the erroneous notion that Japanese peonies are the progeny of some one species. C. S. Harrison in the second edition of his *Peony Manual* talks about the wonderful possibilities of the "new race" of Japanese peonies. This is not a "race" at all according to the definition of race as given by Professor H. J. Webber of this University, for this type may and does appear in several species. It simply represents one method or step in petaloidy of the stamens of any species. It is a horticultural type and is entitled to no botanical standing whatever. Example: *Glory*. (Illustrated on the cover of the *Peony Check-List*.)

Type III, The Bomb—The Bomb is one step beyond the Japanese. The guard petals are still well differentiated from the petaloides, but the petaloides are much wider and no vestiges of anthers should be found upon them. They may have increased in number beyond the original number of stamens by chorisis of the cords. In the typical bomb, the follicles should be well concealed. I regard Chas. Binder as a good example of this type.

Type IV, Semi-Double—Into this type we group those forms which have begun to double without any system. They present in the same flower both stamens and follicles in all stages of transformation. They are usually loose flowers of little character, and in general are undesirable. They are common in any batch of seedlings, especially the semi-double reds; and I am perfectly safe in saying that far too many of them have been given names and places in our lists. It is in this type that the greatest confusion of names exists, and we may find it necessary to use somewhat drastic measures in bringing this group into anything like satisfactory shape; and much is yet to be done before anything like success is achieved.

Type V, The Crown—When the Japanese type retains its narrow petaloids but transforms its follicles into wide petals which resemble the guard petals, we have a two-story effect which is unique and for which I propose the name "Crown." The Crown may be of two kinds: Erect crown or reflexed crown. *Princess Beatrice* (Kelway) is a very good example of this type.

Type VI, The Rose—The Rose type represents the fullest development of which the peony flower is capable. It is fully double, with all stamens and carpels transformed into petals with no vestiges of anthers present and no follicles. Few examples of the Rose type will be found which do not show vestiges of follicles for the crimson flecks present in *Festiva maxima* and *Avalanche* represent the only remains of the lost follicles. These crimson flecks are very common among flowers of this type, and may be found in the double reds on close examination. In the typical Rose form, the guard or primary petals should not be differentiated from the rest; but this is not essential. A good example of the Rose type is *Avalanche* (Crousse).

How Confusion Has Arisen.

The confusion in the names of peonies of which so much complaint is made, has arisen in several ways. Most important of these is the habit of making inadequate descriptions. As an example I may say that the description we have of Mons. Bellart (Delache, 1850), consists of two words, "clear purple." To-day when we have such a large number of varieties on the market, such a description is useless and any description is inadequate which does not give the color, size, season, and horticultural type, together with the species to which it belongs. Other causes for confusion are the poor attachment of labels to the roots, and illegibly written labels. Then, too, the lack of a check-list has resulted in the same name being used over and over again for different seedlings. And then a certain amount of renaming of old varieties for purposes of pecuniary gain has been indulged in by irresponsible growers. I hope that the check-list will be used for reference to all names already published, and that this society may maintain a register to take care of the new acquisitions from year to year.

It remains for the members of this society to all work together to build up a sentiment which will cause every producer of a new variety to send in specimens and complete descriptions, together with a photograph and a proposed name, before he offers the variety to the trade. In return for this the society might issue to him a number and allow him to advertise his new variety as American Peony Society No. —. If the secretary found that the type of bloom he offered for registration was already well represented and that his seedling almost

duplicated several already registered, he could discourage the registration of that name and furnish the grower with the names of those which it already duplicates.

Now, my friends, the question arises, will the growers do all this? I maintain that this plan is perfectly practicable and is the most natural thing to do, and the degree to which it will succeed will depend solely upon the moral strength and commercial prestige of the members of this society and in the degree in which people believe in its honesty and reliability. Whatever work we do with peonies, we must do it carefully and well, and in such a way that it will stand the test of the years. If this is done, peony growers everywhere will covet our registration numbers. If it is not done, they will not care a rap for our numbers. When we come to consider this subject, we find that we are dealing with principles which reach far beyond mere peonies. Whether we have to do with apples or roses, potatoes or chrysanthemums, we must face the question of variety descriptions and variety records, therefore the question arises:

What is a Variety?

Ever since the early forties when C. M. Hovey deluged the readers of "Hovey's Horticultural Magazine" with lengthy discussions in regard to varieties of strawberries down to recent times when the fruit growers of the West were wrought up to such an intense state of excitement over the Gano and Black Ben Davis apple controversy, this question has been the cause of prolonged discussion. One faction holds that every seedling from a plant (which does not come true from seed) is a distinct variety. This idea of a variety is based on its origin. The other faction holds that a variety is a group established by man for convenience of trade. Those persons who describe seedling peonies with the first idea in mind, add greatly to the confusion, for where many seedlings are raised, many of them necessarily very closely resemble each other.

Can the Same Variety Originate Twice?

Here again we have a much fomented question and one which depends for an answer on the idea you have as to what a variety is. I take the ground that a variety is a group of forms which is made for convenience and in which the forms are near enough alike to pass for the same thing in the peony trade. I therefore hold that varieties can and do originate at different times and places and that it is our duty to reduce to synonyms those names which have been given different seedlings of the same variety. We should not be too radical in this, however, but should always allow distinct names for all seedlings which have differences sufficient to be detected by the eye trained for peonies. It seems to me that this is the only way out of our difficulty.

How to Describe Color.

Theoretically we should describe colors in percentages of the primary colors, which may be obtained by rotating a graduated wheel with sliding color scales upon it. This method, however, is too complicated and time-consuming for peony work, and we have therefore to rely upon some color chart. After looking over the various charts available, I am convinced that the chart published recently by the French Chrysanthemum Society is by far the best. I am therefore using this; and giving the popular term for the color for ordinary use. The page and number of the shade are also quoted and may be referred to in case definite and critical comparisons are to be made. The title of this work is "Repertoire de Couleurs" (Index of Colors) and it contains hundreds of charts in almost every conceivable shade.

Appointment of Committees.

RESOLUTIONS: Messrs. S. G. Harris, B. H. Farr and John Good.

PLANT DISEASES: Professor H. H. Whetzel, Cornell University; Secretary A. H. Fewkes, W. C. Barry, Rochester, N. Y.; W. A. Peterson, Chicago, Ill.; A. O. Wild, Sarcoxie, Mo.; and C. S. Harrison, York, Neb.

NEW VARIETIES: Secretary Fewkes, S. G. Harris and C. J. Hunn, Cornell University.

NOMENCLATURE: The following names were added to the committee on nomenclature: Professor Saunders, Ithaca, N. Y.; B. H. Farr, Reading, Pa.; and Jos. Dauphin, Queens, N. Y.

The nomenclature committee reported progress, after which the meeting adjourned.

Friday Afternoon Session.

Mr. Humphreys in reporting for the committee on press and publication recommended that the proceedings of the society be printed for distribution among the members. This was adopted.

The committee on auditing the treasurer's book reported that they had found the accounts correct.

Report of the Judges.

The report of the judges was read by Mr. Thurlow, as follows:

FOUNDED IN 1888

Weekly Medium of Interchange for Florists, Nurserymen
Seedsman and the Trade in General

Exclusively a Trade Paper.

Entered at New York Post Office as Second Class Matter

Published every Saturday by the A. T. De La Mare Ptg. and Pub. Co., Ltd., Proprietors, 2, 4, 6 and 8 Duane Street, New York. A. T. De La Mare, president; Jas. H. Griffith, secretary; David Touzeau, treasurer; Alex. Wallace, editor. The address of the officers is the address of this paper.

P. O. Box 1697. Telephone 3765-6 Beekman.
CHICAGO OFFICE: 127 East Berwyn Avenue.

ILLUSTRATIONS.

Electrotypes of the illustrations used in this paper can usually be supplied by the publishers. Price on application.

YEARLY SUBSCRIPTIONS.

United States and Mexico, \$1.00. Canada, \$2.00. Foreign countries in postal union, \$2.50. Payable in advance. Remit by express Money Order, Draft on New York, Post Office Money Order or Registered Letter.

The address label indicates the date when subscription expires and is our only receipt therefor.

REGISTERED CABLE ADDRESS:
Florex, New York.

ADVERTISING RATES.

One-half inch, 75c.; 3-4-inch, \$1.00; 1-inch, \$1.25, special positions extra. Send for Rate Card showing discount of 10c., 15c., 25c., or 35c., per inch on continuous advertising. For rates on Wants, etc., see column for Classified Advertisements.

Copy must reach this office by 12 noon Wednesday to secure insertion in issue of following Saturday.

Orders from unknown parties must be accompanied with cash or satisfactory references.

Obituary

Albert Frost.

Albert Frost, a florist living in New Augustine, Fla., died at his home there on June 24, 1907, after a lingering illness. The deceased, who had been a resident of this locality for some time, was 65 years of age, and was highly respected. A widow and one daughter survive him.

James Murray.

There passed away at his residence in Newport, R. I., last Saturday morning James Murray, one of the oldest and most highly respected gardeners there. Mr. Murray, who was in his sixty-third year, was born near Kilmarnock, Ayrshire, Scotland, where he learned and for a number of years practiced his profession. About twenty-six years ago he came to this country and immediately took charge of the late Isaac Buchanan's place on Long Island; he remained there a few years and then went to Tenafly, N. J., where he filled a position as gardener on a private place. In 1888 he went to Newport as gardener to Mr. Henry Clews, continuing as such until about two months ago when sudden illness caused him to give up his labors.

Mr. Murray was a man of the loftiest character, quiet and unassuming to the point of being thought reserved, but to those who knew him best he was friendly, kindly and companionable. Like many more of his race he believed that the highest education within his means given to his children was but a duty he owed them in order to the better equip them for the battle of life; acting thus he educated his family of two sons and a daughter accordingly. One son graduated with high honors from Harvard and is now engaged in the civil engineering profession; the other son is in like employment in the Government service, and the only daughter is an artist of great promise.

D. M.

The American Peony Society.

We present in this week's issue a full report of the American Peony Society's meeting and exhibition, held at the State College of Agriculture, Cornell University, Ithaca, N. Y., June 27 and 28, 1907.

This society is to be congratulated on the fact that in some of its operations, particularly in the matter of straightening out the nomenclature of the plant it champions, it was fortunate enough to secure the co-operation of the Cornell horticultural department. The work done there, so far, has been admirably carried out, as witness the excellent check-list of varieties compiled by Mr. Coit, a student at the university, in charge of the peony investigations, and already reviewed in these columns. This is only a beginning; but it is a good start, the list giving, as it does, the names of all peony varieties found in literary records and catalogues dating back many years. No definite attempt has yet been made in the way of positive identification of peonies, that matter being still under investigation and proceeding slowly.

The aim of the society is to secure a working list of, say, 100 or 150 varieties, true to name and description, sorts that can be sold in quantity, so as to put the peony business of the country on a satisfactory commercial basis. This organization will now strive hard to do; and toward that end each grower of peonies, interested in the proper transaction of business, will be requested to send to Cornell University an established plant of each of the varieties he considers commercially valuable for comparison and study. These will be planted in batches under the names given; and an effort will be made to ascertain the correct identity of each variety from the originator's or introducer's records wherever possible.

George S. Green, President-Elect American Seed Trade Association

Among the work done at the meetings last week, which were all well attended, was the establishment of a committee to pass on new varieties, the institution of a committee on diseases of the peony, and the decision to debar from the benefits of the society those found guilty of wilful fraud in the renaming of peonies.

We would direct the special attention of our readers to the very interesting paper of Mr. Coit, appearing in our report of the proceedings. This paper has been carefully prepared, and it contains much valuable information concerning the history of the peony, as well as providing suggestions on the subject of a horticultural classification, and other matters.

The society decided to adopt the chart of the French Chrysanthemum Society as its color standard; Mr. Coit has been guided by the colors furnished in that chart in making his descriptions of the peonies under test at Cornell. There is one drawback to this particular chart that we have already pointed out, namely, the liability of variation in the colors in the process of printing; there is a chance of the impressions on some sheets being lighter or heavier than on others.

Those interested in the naming of new varieties of

peonies should read Professor Craig's remarks on that subject. He recommends short and simple names, and if descriptive of the characteristics of the plants, so much the better. There is one point, however, on which we do not quite agree with Professor Craig. As we understand him, he believes that where two varieties have been given a similar name, at dates little apart, the first variety so named being inferior to the second and later appearing one bearing the same designation, the superior sort should be permitted to be disseminated under the duplicated name. Mr. Craig adds: "This does not strictly carry out the rules of nomenclature, but it carries out the principle of common sense and common usage." Our own opinion is, that were this plan permitted to operate, it would at once open up a way for one variety being substituted for the other; and both sorts bearing the same name, no blame could, we think, attach to anyone for the disappointment or loss that would be sure to ensue. Duplication of names should, as far as possible, be prevented, irrespective of quality, or the lack of it, in the subjects similarly designated; and there is not, as far as we can see, any reason why superiority or inferiority should set aside the principle of well established priority, which should in every case govern plant nomenclature. This latter is a matter which registration can control to a greater or less degree; and for the smoothest possible working along the lines of naming plants, every new variety should be registered after its raiser has decided to introduce it into commerce, and at the earliest moment, with the proper registration bureau.

The American Peony Society seems to have to a great extent solved the problem of how to harmonize amateur and professional interests in an organization of this kind. Classes were provided for amateurs at the recent Cornell show, and it is greatly to the credit of those amateurs who made a display there to have it stated by the judges that their flowers were "equal to anything shown in the exhibition hall," which was saying a good deal. Several new members from the amateur ranks were added to the society, demonstrating an enthusiasm that augurs well for the future.

As will be gleaned from our report, the American Peony Society is showing commendable activity, and its efforts are bound to make for the welfare of the peony cult generally. The society goes to Cornell University again next year, when doubtless a larger gathering of growers will, or, at least, should materialize.

President-Elect A. S. T. A. Geo. S. Green.

George S. Green, president-elect of the American Seed Trade Association, was born near Hannibal, Mo., October 7, 1863. He was educated in Hannibal, and lived there until 1881, when he went to St. Louis, Mo., and entered the employ of D. I. Bushnell & Company, dealers in field seeds. After four years he was admitted to membership in the firm, which connection continued eight years. In 1893, he removed to Chicago and was engaged in the field seed business there until 1895, when the health of his wife necessitated a change of climate and the next six years were spent in the West, most of the time at Colorado Springs, Col.

Since 1901, Mr. Green has been president of The Illinois Seed Company of Chicago, and has thus been interested in the American Seed Trade Association and has regularly attended the annual conventions of that organization.

Mr. Green is a quiet, unassuming man, but a hard worker, and the association, under his presidency, will maintain the high standard to which it has been brought during the past quarter century.

High Ground for Hemlocks

The yellow color observed in hemlocks in some cases is not always on account of fungus at the root, as is sometimes the case with the Norway spruce. It is more often, in fact almost always, caused by the trees being in wet ground. But very few evergreens will thrive in wet places. The common Arbor vite will, if the water is running, but not if it be of a stagnant nature. The hemlock particularly demands a well drained situation. As it grows wild, it is usually on rocky hillsides, often skirting a creek, but it is never seen where water cannot drain from it quickly. It may grow almost close to the water, for it likes a moist air, but if water cannot get away from it quickly, look for yellow foliage and a stunted growth.

Another requisite for the well-doing of the hemlock is, that it has not to meet the fierce winds of Winter. It may freeze to zero, and as much below that as it ever does here, and the tree will not mind it, but set it where the winds play on it all Winter and it will lose its leaves by Spring. It needs planting in sheltered places or several together, so that one protects the other.

J. M.

(Continued from page 15.)

COMMERCIAL CLASSES.

Collection of best twelve and most distinct varieties, six flowers each.—First, C. W. Ward (Cottage Gardens Company), Queens, N. Y. These were all very fine flowers and included the following kinds: Mons. Boucharlataine, Mme. Emile Galle, Claire Dubois, Felix Crousse, Mme. Marie Calot, Couronne d'Or, Modele de Perfection, Marie Lemoine, Eugene Verdier, Louis Van Houtte, Albert Crousse and Denys Helye.

Collection of varieties in various shades of rose pink, three flowers each.—First, Cottage Gardens Company, with Souvenir de Gaspard Calot, Humel carnea, Juliette Desterb, Mons. Barral, Mme. Rota Rendatler, Beranger, Mons. Jules Elie, Marie Deroix, Stanley, Mme. Chaumy, Souvenir de l'Exposition Universelle, Mme. Boulanger and Mathilde Mechin.

Collection of varieties, salmon and flesh colored, three flowers each.—Second, Cottage Gardens Company, with La Coquette, Marie Crousse, Mons. Paillet, Marie d'Hour, Richardson's Dorchester, Mons. Jules Calot, Mathilde de Roseneck, Richardson's Grandiflora, Triomphe de l'Exposition de Lille, Mme. Leonie Calot, Ornement des Massifs, Mme. de Galhau and Mme. Camille Bancel.

Collection of white varieties, three flowers each.—First, Cottage Gardens Company. The varieties shown were La Rozlere, Baroness Schreder, Festiva, Mons. Dupont, Mlle. Rosseau and Mme. Crousse.

No award was made in the class calling for collection of varieties, cream white and light yellow, three flowers each; the blooms shown were flesh white or tricolor.

Collection of crimson varieties, without stamens, three flowers each.—First, Cottage Gardens Company, with the varieties Francois Ortegat, Armandine Mechin, Augustine d'Hour, Victor Hugo, Lee's Grandiflora, Ville de Nancy, Teniers, Number 124, Ambroise Verschaffelt and Meissonier.

No awards were made in classes for crimson varieties, with stamens, and collection of tricolor varieties.

Fifty blooms white.—First, Cottage Gardens Company, with Marie Lemoine; second, Ellwanger & Barry, Rochester, N. Y., with Festiva maxima.

Fifty blooms, dark pink or rose.—First, Ellwanger & Barry, with Modeste Guerlin; second, Cottage Gardens Company, with Mme. Mussyart.

Fifty blooms, flesh or salmon pink.—First, Ellwanger & Barry, with Jeanne d'Arc; second, Cottage Gardens Company, with Mme. de Galhau.

Fifty blooms, crimson.—First, Cottage Gardens Company, with Delachei; second, Ellwanger & Barry, with Rubra triumphans.

In the amateur classes Professor A. P. Saunders, Ithaca, N. Y., was first for collection of salmon and flesh pink varieties, one bloom of each. For best six blooms of any one variety, F. C. Walcott, New York Mills, N. Y., was the winner with Jules Elie.

In a note the judges said: "We wish to call special attention to the high class of the amateur exhibits, the quality of the flowers being equal to anything shown in the exhibition hall."

"The judges recommend that the society adopt rules for the guidance of those judging exhibits from time to time, these rules to cover such points as the correctness of exhibits, in the matter of numbers and colors, as called for by the schedule, and such other items as may properly be governed by exhibition rules."

Owing to the lack of competition Mr. Ward refunded to the society all the prize money won by the Cottage Gardens Company at this exhibition.

Selection of Meeting Place.

On motion of Mr. Humphreys, Cornell University, Ithaca, N. Y., was selected as the next place of meeting, subject to call by the secretary with the view of assembling at the university when the peony flowers would be at their best.

Election of Officers.

The old board of officers was returned, namely: President, C. W. Ward, Queens, N. Y.; vice-president, W. A. Peterson, Chicago, Ill.; treasurer, J. H. Humphreys, Germantown, Pa.; secretary, A. H. Fewkes, Newton Highlands, Mass. George C. Thurlow was elected a director in the place of Theodore Smith of Geneva, N. Y., whose term had expired.

Resolutions.

The report of the committee on final resolutions was read by Mr. Harris. The committee thanked the College of Agriculture for the use of the exhibition and meeting halls; Professor Craig and his assistants for the many courtesies extended to the members of the society; Professor and Mrs. Craig for their generous hospitality. They also expressed to Mr. Coit their appreciation of the great work he had accomplished in compiling the check list of peonies and otherwise in aiding the society. Thanks were given to the officers and committees for their work during the past year, and the committee likewise expressed their heartfelt sympathy with the family of the late F. A. Blake, whose work on behalf of the association was fully appreciated.

New Members.

The following new members were elected: George C. Thurlow, West Newbury, Mass.; Frank Seither, Cleveland, O.; Willis H. Robinson, Flint, N. Y.; George F. Carter, Syracuse, N. Y.; S. G. Harris, Tarrytown, N. Y.; F. C. Walcott, New York Mills, N. Y.; Joseph Dauphin and R. T. Brown, Queens, N. Y.; and C. Ward Welsh, Springfield, O.

Professor Whetzel and J. E. Coit of Cornell University were elected honorary members of the organization.

In speaking of sending flowers to an exhibition at a distance it was stated that those placed in cold storage

before being forwarded were not likely to arrive in good condition. If the blooms were to be stored at the place of exhibition, a storage house with a temperature of 33 degrees was preferred, as at 40 degrees the blooms continue to open right along.

It was decided to print the peony list of A. Dessert of France, copies of which could be obtained from Treasurer Humphreys. The society also concluded to make a charge to non-members of \$5 for a copy of the peony check list, compiled by Mr. Coit. The meeting then adjourned.

Those Present.

The following were among those present at the meetings and exhibition:

Barthol, C. A., Syracuse, N. Y.
Brown, R. T., Queens, N. Y.
Charlton, Mr., Rochester, N. Y.
Coit, J. E., Cornell University, Ithaca, N. Y.
Cowan, J., Oshawa, Can.
Cowell, A. W., Pittsburg, Pa.
Craig, Professor, Cornell University, Ithaca, N. Y.
Dauphin, Joseph, Queens, N. Y.
Dunbar, John, Rochester, N. Y.
Dow, D. M., St. Kilda, Australia.
Farr, B. H., Reading, Pa.
Fewkes, A. H., Newton Highlands, Mass.
George, E. B., Springfield, O.

Peony Mme. Crousse
Cottage Gardens Company

Good, John, Springfield, O.
Harris, S. G., Tarrytown, N. Y.
Hedges, E. B., Westfield, Mass.
Humphreys, J. H., Germantown, Pa.
Hunn, C. E., Cornell University, Ithaca, N. Y.
Maloy, C. J., Rochester, N. Y.
Mullen, H. J., Westfield, Mass.
Peterson, G. H., Fairlawn, N. J.
Reeves, E. A., Cleveland, O.
Robinson, W. H., Flint, N. Y.
Saunders, Professor, Ithaca, N. Y.
Thurlow, George C. and wife, West Newbury, Mass.
Walcott, F. C., New York Mills, N. Y.
Wallace, Alex., New York, N. Y.
Ward, C. W., Queens, N. Y.
Ward, David S., Queens, N. Y.
Welsh, G. W., Springfield, O.
Wild, A. C., Sarcoxie, Mo.
Wilkinson, J. Elliot, and wife and son, Pittsburg, Pa.

HOME-GROWN TEA.—The United States Department of Agriculture will shortly issue a Farmers' Bulletin (301) entitled Home-Grown Tea, prepared by George F. Mitchell, Scientific Assistant, Bureau of Plant Industry. The bulletin describes briefly the methods of growing tea plants and the handling of the same for the production of tea. A practical method is described for the making of tea from the fine leaf, using only such pieces of apparatus as are found in every kitchen.

The bulletin will be of particular interest to persons throughout the South who may desire to grow tea for home consumption. It is illustrated by four text figures. Copies may be obtained by application to the Secretary of Agriculture, or to Senators, Representatives, and Delegates in Congress.

Peonies at the Cottage Gardens, Queens, N. Y.

The peony fields at the Cottage Gardens Company, Queens, N. Y., which cover many acres, were, during the week of June 22 to 29, a perfect blaze of beauty, and at the same time a source of valuable information to those who would see peonies in flower and under their correct names.

During the week referred to we spent a most delightful day with Mr. C. W. Ward among his peonies. He has been specializing with these now for several years, has been buying the newest varieties from all over the world and carefully testing and, with infinite patience, roguing out such as were not true to name, for, sad to relate, some of the peony specialists, Europeans principally, are not wholly to be relied upon in their nomenclature. In all, too many instances Mr. Ward has proved, even among the most expensive varieties, several totally different kinds purchased under the same name.

In the plantation which holds the four-year-old specimens an observer may see the habit, form and color of each variety thoroughly expressed and, not before the plants attain this age, does Mr. Ward think a variety demonstrates clearly its true character. It is from this particular plantation that visitors to the Cottage Gardens were enabled to tell accurately just what each variety looks like, as the most strict attention has been paid to the labeling or numbering of each kind.

The varieties that impressed us as being extremely valuable either for cut purposes or planting for landscape effects, we mention here; and would add that the color, descriptions, etc., are those of Mr. Ward's, whose knowledge, through careful study and inspection since he took up the peony cult some years ago, constitutes him an unquestionable and reliable authority.

Alexandre Dumas. Lively, brilliant pink, interspersed with white, salmon and chamois.

Duchesse de Nemours. Very fine, cup-shaped bloom; sulphur white, with greenish reflex fading to pure white. Exceptionally pretty in the bud. Late, and one of the best of white sorts.

Delachei. Late midseason, deep purple, crimson reflex; strong grower, free bloomer, and one of the most remarkable of the dark peonies.

Delicatissima. Fine, large, very full convex bloom of very clear delicate pink, shading light at center; a vigorous, healthy grower, very fragrant and free and a great cut flower variety.

Jeanne d'Arc. Large, soft pink flower; sulphur white, with brilliant pink center; some petals spotted with carmine; very fragrant, vigorous grower, free bloomer.

Mlle. Leonie Calot. Medium size, very full, compact, ball shaped bloom; color soft salmon flesh, occasional petals tipped carmine; very fragrant and a good shipper and long keeper; late.

Mons. Boucharlait Aine. Midseason, medium-sized; well-formed blooms on erect stems; color bright lilaceous pink with occasional carmine spots on the central petals; good grower, compact habit.

Margaret Girard. Large white variety.

Livingstone. Beautiful pink.

Souv. de l'Exposition Universelle. Fine, full blossoms, color clear cherry with silvery reflex, very fresh rare shade. One of the extra fine sorts. Late midseason.

Alice de Julecourt. Early midseason bloom on strong stems. Color soft salmon-pink, shading to creamy white with carmine veins and occasional carmine spots on center petals. Very healthy, strong grower; very free bloomer, and exceptionally valuable for bedding and landscape work.

Triomphe de l'Exposition de Lille. Late. Medium-sized bloom; soft flesh pink with white reflex; very fresh coloring; compact, erect habit; good grower.

Beauté Française. Delicate flesh pink with purplish white and carmine spots. Nicely formed flower. Grown for the Paris market to a large extent as cut bloom.

Couronne d'Or. Very late. Immense, very full, imbricated, ball-shaped bloom; color snowy with yellowish reflex with light carmine edges on a few center petals. Grand cut flower sort.

Duke of Wellington. Very large, well-formed sulphur white bloom; habit ideal; stems very firm and long; strong grower; very fragrant. The true variety is scarce, as several inferior sorts have been offered under this name.

Festiva Maxima. Early. Enormous, very full shell-formed bloom, often 7 in. to 8 in. in diameter, on strong, 3½ ft. stems; color snow-white, shading to delicate creamy white at base of petals, with an occasional clear purple spot on edges of center petals; very fragrant.

Albert Crousse. Immense; very full, convex peony-formed blooms, fresh salmon pink; moderate grower.

It is evident that the peony has a great future in landscape work; it will be and, in point of fact is now being used on many estates, not by the tens and twenties, but by the hundreds and thousands. As a foreground to a belt of shrubs and trees, set in harmoniously blending colors, in rows two, three or four deep,

high growing varieties in the back, dwarfs in the foreground, what more wonderful burst of color and wave of flower buds, at their blooming period, could so effectively arrest the attention and gratify the eye?

The caution to all dealers is clear if satisfaction is to be given. There must be no mixture of colors; varieties must be true.

There are many other features at the Cottage Gardens Co.'s grounds that are worthy of careful inspection, both in the nursery department and in the carnation growing establishment. The latter has been added to a great extent during the last few months. Several houses have been taken down to make room for more modern structures. Mr. Ward has evidently come to the conclusion that the large house with cement benches throughout is the best equipment for carnation culture, and those who are acquainted with the quality of cut flowers that have reached New York from this place during the last Winter, are fully aware that no better grown carnations can be found anywhere, than those from the Cottage Gardens Company.

The nursery contains blocks of both deciduous and evergreen trees that for size and symmetry are sure to fulfill the most exacting requirements of any customer. The plantings are made at distances that assure each individual tree a sufficient scope to properly grow into its true character.

Rhododendrons are grown in immense numbers, as also are the several varieties of spruce and other evergreens. The herbaceous department is one that is being added to continually, and later in the season the plantings of phlox will be a grand sight and worthy of a special visit.

We must not omit to mention in these notes the splendid office building which Mr. Ward has erected and equipped, and we feel almost safe in saying that this is the finest and best equipped nursery office building to be found anywhere. The first floor is devoted to Mr. Ward's private office, bookkeepers' and stenographers' department; the second floor accommodates the landscape architects and draftsmen. A large club room, beautifully furnished, with kitchen and all the culinary requisites for the accommodation of visitors and the employees on the estate, is also located hereon. The basement is the cooling room for the cut flowers, and is so equipped that it can be kept at any desired temperature. The decorative plantings lining the approach to the office building, consisting of both evergreen and deciduous specimens, and the lawns have all been most artistically done, so that the general effect leaves nothing to be desired.

Peonies in Chicago.

The effect of the meteorological eccentricities of the Spring months of the current year has been evident in many horticultural specialties, but perhaps in none has it been more noticeable than in the annual florescence of the peonies, a period looked forward to every season with unbounded anticipations of pleasure and profit by innumerable lovers and growers of flowers. Chicago is the center of a very large district which contributes each year hundreds of thousands of cut blooms to its market, covering a long period, generally from early in May, when the first *Officialis rubra* known to the cut flower trade here as *Early Red*, makes its appearance from Southern sections, through June, when the local growers contribute their harvest, after which the more Northern shippers of Michigan and Wisconsin continue the supply, for a week or two. Of the locally grown flowers many thousands of dozens are placed in cold storage, which owing to the low rates of the refrigerating houses can be done in the city to better advantage than elsewhere, and this feature keeps the market in ample supply until August.

But this Spring it has been different, as the early crop from the South was practically ruined by the late freezes after an early and favorable start, and so with varying proportions of loss may be followed the northward course until in this latitude it is probable that little damage would have been reported had the season after the freezes been normal; but weeks of lingering cold, wet weather held the buds practically at a standstill they not acquiring the requisite strength and development, until about the middle of June when many varieties were fully two weeks late. Summer weather in its full intensity forced all varieties into flower in a few days regardless of catalogue descriptions as to season, and the fierce rays of the sun, the continued extreme heat, an unusually severe thunderstorm when the flowers were perhaps at their best with the imperfect and unnatural development of the buds, have all combined to produce a short and altogether disappointing peony season.

Notwithstanding the drawbacks which were felt to a greater or less extent throughout this district a visit to the peony section of the Peterson Nursery, at Lincoln and Peterson avenues in North Chicago, last week, proved an interesting and fascinating occasion.

Although it is now more than half a century since this nursery was established it was not until about twenty years ago that William A. Peterson, the

present proprietor, during a trip abroad became so thoroughly imbued with the subject that this branch was made a specialty, since which time in the neighborhood of one thousand varieties have been planted and given a fair trial and discarded or preserved and increased, until at the present time they have upward of five acres containing a large stock of many of the best varieties under cultivation. There are now in the field about three hundred sorts, but many of these are on trial and probably one hundred would be a fair estimate of the number of varieties which are known to be of sufficient importance and individuality to be worthy of further propagation.

One is impressed with the unusually large stocks of the grand white, *Festiva maxima*, of which there are several thousand clumps from one to four or five years old, and the somewhat later *Marie Lemoine*, with its large ivory white blooms in generous quantity. A very large stock has also been worked up of *Mme. de Verneville* which is also classed among the best whites. Another prominent white is *Duchesse de Nemours*. In pink sorts a great favorite is *Livingston*, winner of the first prize for pink at the Chicago meeting of the Peony Society two years ago. *Delicatissima* is largely grown and, though not in as large supply, *Pottsi alba*, delicate flesh pink, may be classed among the most beautiful. *Gigantea* looms up in good form as do *Golden Harvest*, *Armandine Mechin*, *Jenny Lind*, several of Richardson's seedlings, *Emile Lemoine*, *Mme. Forel* and *M. Martin Cahuzac*, the darkest red of all peonies.

Mr. Peterson has also a batch of seedlings containing some pleasing sorts and a number of selected importations of which the stock is yet too limited to say much about.

Peony Souvenir de L'Exposition Universelle

Cottage Gardens Company

In connection with the peony department at this nursery a thorough card system was inaugurated many years ago, so that with the greatest convenience reference may be made to any variety ever tested here with a complete report of the results made under actual observation on the place. Unusual care is taken to keep the varieties true to name and so positive of the absolutely undefiled condition of the stock is the proprietor that he makes a standing offer of three plants for one for any plant from his stock which proves untrue to name, and it is now over four years since a complaint of mixture has been made.

Last year Mr. Peterson was again through Europe making it a point to visit the principal peony growers, but until sufficient time elapses to work up a stock of his purchases it is not likely that much will be heard or seen as a result of his trip.

W. K. WOOD.

ELBERON (N. J.) HORTICULTURAL SOCIETY.—This society held a rose and strawberry show on June 24th, instead of the 17th, as previously arranged. Considering the backward season, the exhibition was quite a success. The principal prizewinners in the rose section were J. Kennedy, A. Greib, A. Bauer, and W. Swain. In the strawberry section the winners were J. Kennedy, A. Bauer and W. Swain. W. D. Robertson was first for the best vase of sweet peas.

The society will hold its second annual show in the New Casino, Long Branch, on July 24 and 25. There is every indication that the exhibition will be a great success.

G. M.

APPRAISERS' DECISION ON CYCAS CLUMPS.—In the protest of Henry & Lee against the assessment of duty by the collector of customs at the port of New York, before Board 1, June 18, 1907, the protest related to merchandise assessed with duty under paragraph 251, tariff act of 1897, and claimed to be free of duty under paragraph 548 (drugs), paragraph 552 (palm leaf), 566 (crude fibrous vegetable substances), or paragraph 617 (crude vegetable substances). Protest overruled.

Following is the opinion of McClelland, General Appraiser: "The special report of the appraiser accompanying this protest states that the merchandise consists of 'cycas stems.' He further states that 'the plants themselves are imported in the shape of dormant trunks or clumps, which are potted and subjected to heat, thus producing root and leaf growth. * * * As the cycas palm can not be transported from the Orient, it is removed from earth, the leaves and roots are allowed to dry off and when this is accomplished the trunk or clump is shipped. * * *

"Counsel for importers have indorsed on the papers the following: Submitted on appraisers report with request for favorable decision. Paragraph 251 provides only for various sorts of bulbs, bulbous roots, and corms, which these are not.

"We have carefully considered the provisions of each of the said paragraphs relied upon by protestants for free entry, but fail to find any one of them that could reasonably be held to cover the merchandise in question; and therefore each of the claims is overruled. Thus it only remains to determine whether the collector's classification under paragraph 251 was the correct one. It may be open to question whether the cycas

palm 'dried off,' with the leaves removed, is a palm within the meaning of the language of said paragraph 251; and we think it unnecessary to decide that question, since if it is not it is certainly greenhouse stock not specially provided for, under the provisions of paragraph 252 of said act, dutiable at the same rate assessed in this case by the collector."

American Gardening One Hundred Years Behind English.

Editor Florists' Exchange:

I quite agree with T. A. Weston in his article of two weeks ago, that gardening generally in America is 100 years behind England! Thirty years ago I attended a big show in a small village of 200 inhabitants in the Welsh mountains, that was a big success in every way. I have frequently attended and made exhibits at the Shrewsbury show. My! But that show is a revelation, forty to seventy competitors in every class. This is one of the places where a man becomes enthusiastic, indeed, it is catching; it is spontaneous. Keen competition with the best of feeling to our brother man. If in America there is a tremendous amount of cold show on exhibition, if a man is a stranger. This is what I found in this City of Brotherly Love; nobody to talk to, or show you round, slim attendance, few exhibitors, sedate, formal, cold; why even our seedsmen have no time to talk to a plain man.

Gardening generally, hereabouts, is unprogressive. Most of the bedding out is done in exactly the same way year after year. There are a few exceptions, of course; but, remember, this is the big city of Philadelphia.

OAKSON EDWARDS.

The Baltimore (Md.) Florists' Exchange.

The Florists' Exchange of Baltimore was incorporated in 1890, by Robert J. Halliday (first president), Wm. McRoberts, and Charles Campbell. These three incorporators have since died. The others were I. H. Moss, Wm. Feast, E. A. Seidewitz, present directors, and John Wedi (not now connected with the trade).

The exchange started on Liberty street in a 16x20 foot basement room and then moved across to the first floor on the Park avenue side; later larger quarters were obtained on Eutaw street.

The business has steadily increased, more especially during the past four years since J. J. Perry became manager.

The quarters on Eutaw street became unsuitable being too small to handle the large amount of business done; and the directors decided to build a suitable structure of their own. A fine piece of property was bought on St. Paul and Franklin streets and thereupon was erected a Florists' Exchange building with exhibition and meeting rooms of large size, as the accompanying illustrations show.

The main storage vault is 16x33 feet, in one end of the cellar, and on the first floor are vaults half the size mentioned. The cost of the building was \$30,000.

An idea as to the business transacted in one year can be had when we state that in the first year of its incorporation, over 17 years ago, more than \$20,000 business was done, and it has increased ever since; during the past four years, since Mr. Perry has had charge, the business has more than doubled.

Building of Baltimore Florists' Exchange

John J. Perry,
Manager Baltimore Florists' Exchange

Mr. Perry has been remarkable successful in the handling of the Baltimore Florists' Exchange and to him is due the recent success; his affability, keen business acumen, together with his personal experience of years past, have fitted him peculiarly as an ideal manager. Of course, success is made easier by the friendly and harmonious co-operation on the part of the board of directors who uphold Mr Perry's hands in all his transactions.

The growers and retailers are both equally interested and the majority of each hold stock in the enterprise; and every member is satisfied that his or her best interests are always looked after.

The present directors are: E. A. Seidewitz, president C. E. Akehurst, Wm. G. Lehr, F. C. Bauer, I. H. Moss, Wm. Feast, and J. M. Rider.

CHAS. L. SEYBOLD.

History of the St. Louis Florists' Club.

The St. Louis Florists' Club was organized June 28, 1897, in the rooms of the Mercantile Club. There were present at the first meeting the following florists: J. M. Jordan, S. Kehrman, L. Armstrong, J. S. Wilson, Wm. Ellison, Chas. Connon, Chas. A. Juengel, E. W. Guy, R. Frow, H. Michel, Alex. Waldbart, Wm. Schray and Julius Koenig, Sr. Of these five are dead—J. M. Jordan, Chas. Connon, H. Michel, Wm. Schray and Julius Koenig, Sr.; four are still members of the club—J. S. Wilson, Chas. Juengel, E. W. Guy and R. Frow. Messrs. Kehrman, Armstrong, Ellison and Waldbart are still among the living, but not members of the club.

The first officers of the club were: J. M. Jordan, president; H. Michel, vice-president; L. Armstrong, secretary, and A. Waldbart, treasurer; Messrs. Kehrman, Connon and Juengel, trustees.

The club continued to meet in the rooms of the Mercantile Club until May 13, 1890, with a membership of 17, after which it met in the Odd Fellows' Building.

In 1888 Chas. Connon was elected president; the secretary, vice-president and treasurer holding over, the club now having increased its membership to 23. In August, 1889, H. Michel was elected president, Wm. Schray, vice-president; S. Kehrman, secretary, the treasurer holding over. April 8, 1890, H. Michel resigned as president, and J. M. Jordan was elected to fill out the vacancy. August, 1890, Chas. Connon was again elected president, the other officers holding over.

The following August, 1891, the club's annual election was held and Eugene H. Michel was elected president; Julius Koenig, Sr., vice-president; Emil Schray, secretary, and Alex. Waldbart, treasurer. In 1892 John Young was elected president; R. F. Tesson, vice-president; the secretary and treasurer holding over. The following year Alex. Waldbart served as president; Julius Koenig, Sr., vice-president; F. C. Weber, treasurer, and Emil Schray, secretary. The trustees were Bencke, Jordan and Michel. The following year Alex. Waldbart was re-elected president; Frank J. Fillmore, vice-president; Emil Schray, secretary, and John Young, treasurer. The club had now increased its membership to 35.

In 1895 Frank J. Fillmore was elected to fill the presidential chair, with C. A. Kuehn as vice-president, the other officers holding over. The following year, 1896, John W. Kunz was elected president; Frank J. Fillmore, vice-president; secretary and treasurer the same as last year. The membership had now increased to 40.

The following year Dr. A. S. Halsted served as president, with F. W. Ude, Jr., vice-president; secretary and treasurer holding over. In 1898, C. C. Sanders was elected president; Max Herzog, vice-president; E. Schray, secretary, and J. J. Bencke, treasurer. The following year, 1899, J. F. Ammann served as president; C. A. Kuehn, vice-president; secretary and treasurer as before. E. W. Guy occupied the chair in 1900, with Chas. Juengel as vice-president; E. Schray, secretary, and J. J. Bencke, treasurer. In 1901, Fred H. Meinhardt was elected president, with F. M. Ellis as

vice-president; secretary and treasurer holding over; the club now having a membership of 50. In August, 1902, J. W. Dunford was elected president; George B. Windler, vice-president; secretary and treasurer holding over. In August, 1903, J. J. Bencke was elected president; Wm. Winter, vice-president; E. Schray, secretary, and Otto G. Koenig, treasurer. This was the banner year of the club, the membership being increased to one hundred.

In August, 1904, Chas. Juengel was elected president, with W. J. Pilcher, vice-president; F. H. Meinhardt, treasurer, and E. Schray, secretary. The following year, 1905, J. F. Ammann served his second term as president, and John Steidel as vice-president; E. Schray serving his fifteenth year as secretary, with F. H. Meinhardt, treasurer. New trustees were: Carl Beyer, Frank Weber and F. J. Fillmore. Under the new by-laws Mr. Beyer was to serve three years, Frank Weber, two, and F. Fillmore, one.

In August, 1906, the present officers were elected: H. C. Irish, president; John Connon, vice-president, and J. J. Bencke, secretary; A. G. Bentzen, treasurer, with Wm. Smith as a three-year trustee. The membership of the club is at present 101.

The club, since its organization, has had opposition from some dissatisfied members, but all fell by the wayside and returned to the parent body.

The club, in its twenty years of existence, has had 17 presidents, 7 treasurers, and 4 secretaries, and has entertained two S. A. F. conventions; the first in 1893 and the other during the World's Fair year, 1904.

J. M. Jordan, the first president, served the S. A. F. as its president in 1890 when the convention was held in Boston, Mass. Professor Wm. Trelease served the S. A. F. as vice-president in 1893, and J. J. Bencke in 1904.

The club at present is in a most prosperous condition with all of its members working in perfect harmony. Meetings have never been so well attended as at the present time. Its meetings are held every second Thursday afternoon at 2 o'clock. The annual election of officers will take place August 11, when a new set of officers will be elected to serve the ensuing year.

ST. PATRICK.

Interior of Baltimore Florists' Exchange

DIRECTORY OF RELIABLE RETAIL HOUSES

The retail florist firms advertising under this heading will accept and fill orders for flowers and floral designs forwarded them by mail, telegraph or telephone, the usual commission of 25 per cent. being allowed.

\$25.00, payable quarterly in advance, will entitle the advertiser to a four-line card, under this heading, for one year, 52 insertions. For every line additional to four, \$5.00 will be charged. Four lines will average 32 words: each additional line, 9 words. Each advertiser receives one copy, free, of our Florists' Telegraph Code.

New York.

YOUNG & NUGENT, 42 West 28th St. We are in the theatre district and also have exceptional facilities for delivering flowers on outgoing steamers. Wire us your orders; they will receive prompt and careful attention.

MYER, 611 Madison Ave. My facilities for delivering flowers for any and all occasions are unexcelled. Can give prompt service to steamer and theatre trade. Telegraphic orders solicited. Telephone, 5297 Plaza.

Kansas City, Mo.

SAMUEL MURRAY, 1017 Broadway. I will deliver orders for flowers in Kansas City and vicinity promptly. A first-class stock of seasonable varieties of flowers always on hand. Wire me your orders.

Washington, D. C.

GUDE BROS., 1214 F Street, N. W. We excel in high-class flowers and design work of every description; quick service, reasonable charges and liberal treatment have placed us on top. Try us.

Milwaukee, Wis.

THE C. C. POLLWORTH CO., Wholesale Florists, will take care of all your Retail orders for the delivery of flowers anywhere in Wisconsin.

Detroit, Mich.

JOHN BREITMEYER'S SONS, Broadway and Gratiot Avenue. We cover all Michigan points and large sections of Ohio, Indiana and Canada. Retail orders placed with us will receive careful attention.

Denver, Colo.

THE PARK FLORAL CO., 1706 Broadway, J. A. Valentine, Prest. Orders by wire or mail carefully filled; usual discounts allowed. Colorado, Utah, Western Nebraska and Wyoming points reached by express.

Cincinnati, O.

HARDESTY & CO., 150 East Fourth, sell the best grade of flowers grown. Retail orders from distant points for delivery in Cincinnati or surrounding territory will receive prompt attention. Telegraph us.

Dayton, O.

W. G. MATTHEWS, FLORIST, 16 West Third Street. Flowers in any arrangement for all occasions for Dayton and vicinity. Personal attention given to all orders. Long distance telephones.

Dallas, Texas.

LANG, THE FLORIST, the largest flower store in the South. Floral designs and all flowers in season; personal supervision and prompt service in Oklahoma, Texas, Louisiana. Mail and telegraphic orders solicited.

Louisville, Ky.

JACOB SCHULZ, 644 4th Avenue. Personal attention given to out-of-town orders for Louisville and surrounding territory. Have a choice line of seasonable flowers always in stock; delivery facilities perfect.

Indianapolis, Ind.

BERTERMANN BROS. CO. Our facilities for executing orders in an efficient manner are unexcelled. Our shipping territory includes the surrounding states. High grade flowers; expert workmanship.

Albany, N. Y.

EYRES, 11 North Pearl Street, cut flowers or floral designs delivered to any part of Albany and vicinity on telegraphic order. Personal attention given and satisfaction guaranteed.

Chicago, Ill.

HAUSWIRTH, The Auditorium Florist, 232 Michigan Avenue. The quality of our work is of National repute, and we are prepared to execute commissions in first-class style in Chicago and its environs.

The Michell Bowling Trophy.

We picture in this issue the Henry F. Michell Company's Bowling Trophy. It is to be contested for annually by the bowling clubs of the Society of American Florists, and becomes the property of the club winning it three times.

The first series of games will be played in Philadelphia from August 20 to August 24.

The trophy, which was designed and made by Maxwell & Berlet, Inc., of Philadelphia, is a superb plaque of Flemish oak, 14 inches long by 12½ inches wide, on which is applied a handwrought copper shield; this, in turn, is embellished with a solid silver shield, on which is etched a series of bowling alleys and a bowler about to play. The details of this etching are particularly interesting; the perspective is perfect while even such small details as the score board, sponge and cup, sand box and hand cloth are not omitted. In each corner of the Flemish oak background is applied a massive solid silver bowling ball, on which will be engraved each year the names of the successful contesting club. The copper and solid silver shields are secured with handwrought rivets.

The entire piece suggests the arts craftsmanship which has sprung into favorable prominence during the past year.

This valuable trophy, through its originality, reflects great credit on its donors—the well known seedsmen, the Henry F. Michell Company, 1018 Market Street, Philadelphia, Pa.

Gladiolus America.

Editor Florists' Exchange:

We note Mr. Groff's article in your issue of June 22 regarding Gladiolus America. We still make our claim that if Mr. Groff produced America he would still have some of the stock in his collection, but if he has not, certainly the customers to whom he claims he disposes of his stock every year in mixtures would have America in their collections, and we cannot believe that all of his customers would have overlooked such a fine variety as America is. He may not have no-

ticed its merits, but certainly every other grower that has purchased of him would not have overlooked them.

We think Mr. Groff ought to study the species of Saundersoni a little more closely before he makes the statement that they do not produce cormels after the habit of America. He also states that Mr. Banning and ourselves ought to be able to agree in our stories regarding America. If he will point out to us where we do not agree we would be glad to have him do so. He says in his article that the challenge to supply some corms of his number 119 for testing comes two months after planting time. As a matter of fact we wrote him a personal letter asking for some cormels in the middle of May. If he had had his stock planted for a month at that time we cannot see wherein he has any short season, as one of his contentions is that the America bulbets do not mature on account of their short season. If he can plant by the middle of April, he certainly gets his bulbs in the ground as early as the Ohio growers do on their heavy soil and much earlier than we get the last of our bulbs in, and both the Ohio growers and ourselves have no trouble in maturing the bulbets. He makes the statement that he is quite able to settle the controversy without bringing forward his customers as witnesses. We think that this contention would not hold good in case of any court trial, as certainly a case without witnesses would not have much chance of success.

We also note in your issue of June 29 another article along similar lines, and although the article is not signed (it was written by Mr. Christy, Ed. F. E.), we presume is from Mr. Groff and it appears to us to be another futile attempt to establish a claim for which he has no grounds whatever. If he parted with the original bulb and threw away the cormels without knowledge of their value and after several years some one introduces a new variety, we cannot see where he can make a claim for its production any more than any other gladiolus grower in the country. We think that we would have just as much cause for saying that America originated on our grounds and was sent out years ago in a mixture of seedlings and then was discovered by someone else.

JOHN LEWIS CHILDS.

New York Florists' Club Outing.

The seventh annual outing of the New York Florists' Club came off on Tuesday, the 2nd inst., and was one of the most enjoyable affairs the club has ever held. The weather was just as perfect as it was possible to be, and the crowd, which numbered about three hundred persons, boarded the steamer Isabel at Thirty-first street and the East River at a few minutes after 10 o'clock in the morning and proceeded up to the sound, reaching Witzel's Point a little after noon, where a good dinner had been provided by the managers of this favorite picnic grove. After the dinner, a group photograph was taken; then the children's races and other athletic sports were held in the field adjoining the grove, and it was one regular round of merriment and laughter until time to start for home again.

Through the efforts of the outing committee a grand array of prizes had been provided for the contestants in the different events. These outings are growing in popularity, particularly among the younger generation of the florists' families, and more provision will have to be made for children's races, as the track at Witzel's Point is not wide enough by

Boys' race for those under five years of age—A. Adams, first; R. Hildenbrandt, second; P. Kessler, third.

Girls' race for those between five and six years of age—Miss Schmill, first; Miss Kessler, second; Miss Marien, third.

Boys' race for those between five and six years of age—J. Walters, first; J. Scott, second; J. Adams, third.

Girls' race for those between six and seven years of age—Miss E. Schmutz, first; Miss Muller, second.

Boys' race for those between six and seven years of age—G. Walters, first; D. Marshall, second; M. Einsman, third.

Girls' race for those between seven and eight years of age—Miss A. Kessler, first. She ran this race alone as there were no other competitors that could qualify on account of age.

Boys' race for those between seven and eight years of age—I. Freedborg, first; M. Henry, second.

Girls' race for those between eight and ten years of age—Miss E. Adams, first; Miss M. Marshall, second; Miss H. Totty, third.

Boys' race for those between eight and ten years of age—R. Burnett, first; W. Manda, second; G. Manker, third.

Girls' race for those between ten and twelve years of age—Miss Manda, first; Miss Strahle, second; Miss Einsman, third.

Boys' race for those between ten and twelve years of age—E. Einsman, first; A. Weston, second; H. Dryer, third.

The ladies' bowling was a very interesting event, and was in charge of R. Schultz. There were twenty-five prizes, and they were awarded in the following order: Mrs. Donaldson, 59; Mrs. R. Whitman, 54; Miss B. Riemels, 52; Mrs. Irwin, 47; Mrs. H. Riemels, 45; Mrs. G. C. Farr, 43; Mrs. Hopwood, 42; Mrs. F. L. Enggren, 38; Mrs. D. S. Adams, 38; Miss M. Matthus, 38; Mrs. F. Lentz, 36; Miss Warshaw, 36; Mrs. J. Vocke, 35; Miss Gaynor, 34; Mrs. P. Einsman, 33; Miss Strock, 33; Mrs. A. L. Rickards, 33; Mrs. W. Frank, 33; Mrs. Monsees, 33; Mrs. Harry A. Bunyard, 32; Mrs. Schenck, 31; Miss Managh, 30; Miss Bell Scott, 30; Miss Foley, 30. Consolation prizes were awarded to the following: Mrs. Weisenberg, Mrs. W. S. Marshall, Mrs. Duckham, Mrs. P. Kessler, Mrs. M. Wocker, Mrs. L. Klein, Mrs. G. Weppeler, Mrs. J. H. Kemper, Mrs. A. M. Henshaw and Miss Jessie Scott.

The contestants for the baby prizes were many, and the task of the judges, Harry A. Bunyard and John Scott was a difficult one. At the wind-up, however, every baby was awarded a Teddy bear, so that there was no complaint or dissatisfaction.

Music was furnished during the dinner and on the boat by the Metropolitan Band and Orchestra, under the direction of G. Peluso. The steamer arrived home about 8 p. m. Everybody was happy; the day had been

Newport, R. I.**News and Trade Notes.**

Peonies and hybrid roses are not much called for in decorations for small dinner parties here, but when something elaborate and extensive is attempted they are used in large quantities. This week Clarence Dolan of Philadelphia is to give a dinner and a varied entertainment to the Clambake Club for which Leikens has received the contract for the floral decorations. These are to consist mainly of four huge centerpieces in the form of pyramids of peonies.

Although the price at which these flowers are now offered seems low, still there is a margin of profit in their sale. Peonies should be dipped in water immediately after being cut and also sprinkled overhead.

A year or two ago anyone in the possession of one or more large latanias and wishing to dispose of them would have considerable difficulty in inducing anybody to take them for nothing; now there seems to be quite a demand for these plants. Leikens is hunting for a number of large specimens for the decoration of the Hotel Belmont in New York.

What has been said of latanias can be also said of large specimens of Pandanus

Members of the New York Florists' Club and Their Families at Seventh Annual Outing held at Witzel's Point Grove, L. I., July 2, 1907

any means to afford room for all the children who are desirous to run, though by spreading some of the events into two or three heats, the young athletes all get a chance; but some of them object to having to run more than once to obtain a prize.

The baseball game was quite a spirited affair; it was between the single and married men, and the prizes were ten bottles of wine. The married men were captained by H. Hoffmeyer, who had on his staff J. Foley, R. Irwin, E. Greatfield, A. Rickards, G. Hildenbrandt, Otto Hartstock, D. Sullivan and F. Lentz. The single men were captained by Percy Rodgers, who had lined up with him A. Hopwood, H. Rann, J. Manda, T. Pyne, O'Hara, E. Frank, J. Dupuy and G. Klecklar. The single men were the winners by a score of five to four. L. W. Wheeler was umpire and L. Klein, scorer.

In the races for the children and ladies the judges were Walter F. Sheridan and John Young. Charles B. Weathered was the official secretary, and as there was a prize for almost everybody, his was a difficult job. A. M. Henshaw was starter and Frank H. Traendly, master of ceremonies.

In the girls' race for those under five years of age, Miss Peterson was first; Miss Woodruff, second; Miss Hauk, third.

Girls' race for those between twelve and fourteen years of age—Miss M. Schenck, first; Miss J. Birnie and Miss Lucy Butterfield tied for second place.

Boys' race for those between twelve and fourteen years of age—L. Schenck, first; E. Manda, second; T. Adams, third.

Girls' race for those between fourteen and sixteen years of age—Miss A. Birnie, first; Miss P. Rose, second.

Boys' race for those between fourteen and sixteen years of age—R. Young, first and R. Jenicke, second.

Girls' race for those between sixteen and twenty years of age—Miss Vocke, first; Miss Rose, second; Miss Matthews, third.

Young ladies' race for those over twenty years of age—Miss Manda, first; Miss A. Birnie, second; Miss J. Scott, third.

Married ladies' race—Mrs. Woodruff, first; Mrs. Lentz, second; Mrs. Hildenbrandt, third.

Married men's race—J. Hauk, first; H. Hornecker, second.

In the 150-yards race for club members only, P. Kessler was first; J. Manda, second; W. Marshall, third.

Fat men's race—F. Einsman, first; A. J. Manda, second; F. H. Traendly, third.

Quarter-mile race, open to all—E. Ceacis, first; R. Irwin, second; H. Handel, third.

Consolation race for young men between the ages of sixteen and twenty years—H. Adams, first; G. Klecklar, second; W. Zvolanek, third.

beautiful and had passed off without a single accident, thanks to the efficient committee and the fellow members of the club who so generously turned in and helped. The prizes awarded were all beautiful and were thoroughly appreciated by all who were fortunate enough to win them.

Thus passed into history the seventh annual outing of the New York Florists' Club, and may we have many more like it.

At the Outing.

Hello, Schmutz! Come in to the bar. I'm dry.

Louis Schmutz, pulling his friend Herman Dreyer forward—All right, here's a drier; let's go.

F. H. Traendly to his one-year-old baby seated in his papa's hand while the group photograph is being taken—"Control yourself for a few moments."

It was rather hard on the orchestra to ask them to play "The Wearing of the Green," when Scotch airs and "Poor John" seemed to be as far into the classics as John Birnie would allow them to go.

Al. Rickards tried to win his race by sliding in. He caught a stone, turned a somersault, tore his pants, and found his wife, who had a needle and thread, fortunately.

Veitchii for which there is likewise a demand and presumably for like purposes; in fact, there is money in large decorative plants of all kinds and it would seem to be good policy for those in possession of such to look after them in anticipation of the call coming their way.

Large ferns are also always in good demand in Summer; the Newport florists cannot possibly pick up anything like the number they want. And again, in Winter the demand in the large cities for these is far ahead of the supply. In proof of this I would cite the instance of one of the largest growers of ferns in the vicinity of New York journeying to Newport in search of large plants to fill an order. D. M.

Wasn't Asking Much.

A florist of Philadelphia was one day making the rounds of his properties near that city when he was approached by a young man, who applied to him for work.

"I am sorry," said the florist, "but I have all the help I need. I have nothing for you to do."

"Sir," said the young man, with a polite bow, "if you only knew how very little work it would take to occupy me!"—Success Magazine.

Indianapolis.

News Items.

Tomlinson Hall market was well supplied with stock the past week and business was highly satisfactory. Quite a little profit is made from the tubs of field daisies sold there.

The florists' picnic at "Willowmere" was thoroughly enjoyed by all who attended.

A majority of the flower stores are closing at six p. m. daily, Sundays at noon. It is hoped that this time will be uniformly adopted.

The S. A. F. meeting at Philadelphia will probably be attended by a number of Indianapolis florists; several have already signified their intention of going.

Much sympathy is extended Mr. Bucheide in the loss of his daughter Bertha.

Clarence Thomas is spending his vacation in Louisville.

August Rieman is to make extensive improvements during the Summer.

Wilbur Byers, Franklin, Ind., intends erecting another greenhouse. I. B.

DAVENPORT, IA. — The Tri-City Florists' Club held a strawberry social at the establishment of Ewoldt Brothers on June 25. Some fine large strawberries were served, being of a variety raised on the Ewoldt farm and called the "Edna." It is a choice berry with an excellent flavor, and all of the fruits are of large and uniform size. At the business meeting of the club the picnic committee reported having practically completed the arrangements for the annual outing of the members and their families, to take place Thursday, July 11, which is also the date of the next regular meeting of the club. The affair will be held at a place well suited for the occasion and located near the Black Hawk's Watch Tower.

Rose culture was the topic for general discussion. Theodore Ewoldt showed some fine specimens of Richmond rose.

Robert Grapengeter was elected to membership in the club.

MASTICA
 FOR Greenhouse Glazing

OUR NEW CARNATION

"ANDREW CARNEGIE" (Snow's Red Sport of Harlowarden)

WE BEG TO ANNOUNCE that we will offer to the trade the coming season 1907-1908 the new carnation "Andrew Carnegie," a rich scarlet sport of Harlowarden sported with us and Mrs. Jennie P. Snow of Sharon, Mass., from the well known variety Harlowarden, a variety of great value and a favorite in its color.

We have tried the variety the past two years and now offer to the trade the scarlet we have all sought but failed to find. **But we have it now.** The color is a rich scarlet the same as you find in Cardinal which is the ideal shade of all other scarlets now on the market. No rust or other diseases. Habit and growth the same as Harlowarden.

We cannot speak too highly of this new carnation as

the original Harlowarden was the best carnation on the exhibition tables for many years and is still the best of its color; the greatest money maker we ever grew. You know for yourself what a grand variety it is. You will find it in nearly every greenhouse establishment.

We have secured a large stock of this new carnation "Andrew Carnegie" in addition to our own stock and are ready to book orders for good, strong, healthy cuttings at \$12.00 per 100; \$100.00 per 1,000; 2,500 at \$95.00 per 1,000; 5,000 at \$90.00 per 1,000; and 10,000 at \$80.00 per 1,000.

All orders filled from our place strictly in rotation; First come first served. Get your order in early and avoid the rush.

REVIEW OF THE MARKET

NEW YORK.—The cut flower business is about at its dulllest point of the year, and it seems almost a pity that such a large quantity of stock is being shipped to this market, while there is so little doing. Peonies are still coming in, and perhaps there was never before a season when these flowers were cut from the fields so late. The placing of cut peonies in cold storage is not practiced to any extent in this city; in fact, we have not heard, so far, that any have been put in storage, though contrary to the Chicago dealers, those here are not given to letting the world know what they are doing, and there might be thousands of peonies in storage to be brought out at the right moment.

American Beauty roses seem to be almost the only flowers that are bringing a price; everything else is in such quantities that it is cleaned out at any figure. Both Bride and Bridesmaid roses still come in heavily; and of carnations, there seems no end. Usually by this time, many growers have thrown out their plants, and the market is quite depleted, giving a chance for the Summer stock to have an inning, but this year is an off year anyhow, and the outdoor flowers are not getting a show.

Cattleyas and gardenias are plentiful; and it is a problem what to do with them all. Iris is in quantity, but in competition with sweet peas, gladioli, lilies, corn flowers, etc., sells but indifferently. Ferns, asparagus and smilax are all plentiful, with no signs of a shortage on any of them.

CHICAGO.—Little can be said of the market further than that Summer conditions seem thoroughly well established, and to readers of experience that expresses a great deal. Good stock, which is limited in supply, finds a ready sale at about quoted prices, while the usual abundance of Summer goods in seasonable assortment at Summer figures passes in and out of the wholesale stores every day. W. K. W.

PHILADELPHIA.—Owing to the low prices obtained for cut flowers there has been a considerable falling off in the supply this week; but even now it is in excess of the demand. There has been very little call locally, and shipping orders have diminished considerably. On Tuesday, American Beauty roses were reported scarce. Prices on all stock are still low. D. R.

BOSTON.—The Summer season is now on in earnest and little is doing in the cut flower trade. While June was fairly good, now all the occasions which require floral decorations seem to be over, consequently trade is practically at a standstill. Peonies, this year, to the grower have been in the main a failure, for they were not early enough to be used during the June wedding decoration season, and the past week there have been quantities of them on the market which went mainly into the rubbish barrels. Roses sell at anywhere from 50c. up to about \$6 per 100. While the number of American Beauty that are in go fairly well, the finest long-stemmed grades running as high as \$3 per dozen. Carnations continue very good, but bring low prices, few of them reaching as high as \$2 per 100. Sweet peas are plentiful at from 15c. up to about 50c. Lily of the valley brings from \$1.50 to \$4. There are very few lilies in this market. J. W. D.

ST. LOUIS.—Business has now reached Summer dullness, and very little will be doing from now on. Funeral work is about the only thing we can depend on at the present time. Most of the retailers have begun to remodel and paint their places, letting their help take their vacations. The greenhouse men are kept busy pulling out old stock to make room for new.

Stock in almost all grades at the wholesale houses is still very plentiful; extra fancy roses are difficult to obtain. The roses coming are badly mildewed. Prices are low; the very best roses are selling at \$5 per 100; from this down to as low as \$10 per 1,000.

Carnations are showing the effect of the warm days. Those in the fields are doing badly owing to too much rain, and a decided scarcity is looked for in the near future. The selling price the past week was from \$1.50 to \$2 for extra fancy stock; 75c. to \$1 for next choice.

Sweet peas are so plentiful that one can hardly quote prices on them; 10c. per 100 is asked for the best, and 75c. per 1,000 for next choice. All outdoor

stock is not bringing much and is mostly thrown away. Greens are in plenty.

During the months of July and August our wholesalers will close their shops at 5 p. m. and on Saturdays at 12 o'clock.

ST. PATRICK.

INDIANAPOLIS, IND.—Business has subsided into the regular Summer channel. The greatest dependence is placed on funeral work, and of this there is a liberal supply and much available stock is used to advantage. A quantity of select roses, sweet peas and garden flowers are used daily for the counter trade, which is unusually good for this season.

Carnations are suffering from the heat and the last heavy crop is over with; \$1 to \$2 a hundred in the wholesale price for them, 50c. to 75c. retail. Sweet peas of fine quality are overabundant at 20c. to 30c. a hundred; large bowls of them in the flower shops are the most attractive article in sight. Lillium candidum is the only lily in the market, selling at 12 1/2c. a stalk.

Garden flowers, such as coreopsis, cornflowers, heliotrope, daisies, mignonne, etc., are finding a ready market. Kaiserin Augusta Victoria, Richmond and Killarney roses are the best of their class to be had at \$8 to \$10 a hundred; a few La France sell well at the same figure. Bride and Bridesmaid are unfit for the best class of trade; they sell at \$3 to \$4 a hundred. The first asters were offered this week at \$2 per hundred. White dahlias are showing up early, going at \$3 to \$4 a hundred.

Elegant fern leaves, a long-looked-for article, are being shipped in from Michigan points. I. B.

GRAND RAPIDS, MICH.—The hot wave, that struck town early in the month, gave planting out a much-needed boom, and has cleaned out every saleable geranium and other bedding plant. Basket and box filling also continue.

Flowers are plentiful, roses in particular are poor. Prices obtained this year were higher than last year. It was a surprise to all the florists the little trouble it was to get more for plants and flowers than formerly, especially plants. Retail prices were: Geraniums, \$1.50 per dozen, as against \$1 last year. Coleus, etc., 75c., against 50c. All 4-inch plants sold on the geranium rate. Refilling 12-inch hanging baskets, \$1.25, former price, 75c.; new basket, \$1.50, last year, \$1. Filling window or porch boxes, 8-inch wide, 50c. per foot; new box, 70c. per foot; last year, refilling, best 40c., new box, 60c. The price of box filling is still too low, and some firms declare they will not fill a box under 75c. Considering how easy it was to get the advanced prices this year, it is more than likely boxes will go to 75c. next season, when the schedule will be in every respect satisfactory. The local papers published a very nice article, explaining why the prices were higher, laying it to the early heavy frost of last Fall, and that, with the return of natural conditions prices would drop again. It is extremely doubtful if prices will ever drop to where they were, not in a hurry anyway.

The backward Spring, with its frequent heavy frosts, had a bad effect on early-planted carnations. One firm will not save more than 6,000 out of 25,000 planted; other patches have stood still or suffered more or less loss. Crab & Hunter's loss on 110,000 plants put out will not exceed eight per cent. Henry Smith planted from 3-inch pots and hit the weather conditions about right by waiting until danger from hard frosts had passed.

All are getting busy with chrysanthemum and rose planting, and preparing for carnations for later in the month.

Cut flower prices are: Roses, \$1; American Beauty, \$1.50 to \$3 per dozen, and very few to be had at any price. Carnations are holding up steadily at 40c. per dozen; lilies, \$2.50 and sweet peas, 10c. per dozen. E. F. C.

CINCINNATI.—Carnations are still flooding the market and selling for a song, but we hope this state of affairs is about over. Good roses are scarce, but there is still enough to supply the demand. Sweet peas, like carnations, are a decided glut, and selling cheap. Peonies are really the best stock handled now. With the advent of July house cleaning will commence in earnest and the supply of stock slacken. Most of the wholesale houses will close their places of business at 5 p. m. until September 1. E. G. G.

THE METAIRIE RIDGE NURSERY COMPANY LTD

NEW ORLEANS, LA.
GROWERS OF CHOICE CUT FLOWERS
Roses, Carnations, Orchids, Etc.

We are fully prepared to fill orders for shipping by Steamers and Express all through the Southern States

BUFFALO, N. Y.—The market seems to be flooded at the present time with peonies, especially the dark colored ones, the retailers finding it hard to dispose of them at any price. The supply of carnations remains heavy, with very little demand for them. There seems to be very little chance of receiving any asters from this market before August 1; everything seems to be just one month late in this locality. Sweet peas are making their appearance in quantities with stems a trifle short. A few good American Beauty roses are coming in from Philadelphia.

Business the last two weeks in June was very heavy, with lots of flowers; the ordinary demand for commencement and graduation bunches was filled with satisfaction. W. H. G.

FIRMS WHO ARE BUILDING.

TOWA CITY, IA.—W. C. Russell has purchased ground here on which he will erect a greenhouse.

EL PASO, ILL.—The El Paso Carnation Company has ordered material for two new greenhouses to be erected on their grounds.

ANAHEIM, CAL.—Tim Carroll, nurseryman, is building a large greenhouse and a lath house covering a half acre or more of land.

CHAMPAIGN, ILL.—The Board of Education has decided to erect a greenhouse here, to be cared for by the students, especially the members of the botany classes.

DULUTH, MINN.—A building permit has been granted to W. W. Seekins for the erection of a combined greenhouse and flower store on Superior street between Third and Fourth avenues east, to cost \$18,000.

CHANGES IN BUSINESS.

GRAND RAPIDS, MICH.—The firm of Cunningham & Scott has been dissolved; Mr. Cunningham continues the business.

COUNCIL BLUFFS, IA.—The Council Bluffs Nursery Company has been incorporated with a capital stock of \$75,000.

CHEYENNE, WYO.—Garwood, the florist, has purchased a building on Ferguson street, and will shortly move his establishment to that place.

LAWRENCE, MASS.—Owing to failing health and advanced years, L. Davenport has sold out his establishment to Lou Burnham, of Methuen, and retired from business.

LONDON, ONT.—The firm of J. Gammage & Sons, Limited, has been incorporated, and capitalized at \$100,000. Provisional directors—George Nelson Weeks and Henry Stephen Blackburn, esquires; William Wallace Gammage, florist, all of London.

PORTLAND, IND.—The J. M. T. Wright Nursery Company has been lately re-organized and incorporated, with an increased capital stock. J. A. Shewalter has been elected president, Jacob M. Spade, vice-president, M. A. Wright, secretary, and J. M. T. Wright, manager.

TERRE HAUTE, IND.—Mrs. Lawrence Heintz, widow of Lawrence Heintz, is selling out her floral establishment. The five acres of land on which it stands at Seventeenth street and Washington avenue will be platted in city lots and sold. Mrs. Heintz will remain for the present the homestead on the old place.

ROCHESTER, N. Y.—A certificate of incorporation has been filed with the secretary of state at Albany by Glen Brothers, nurserymen, of this city. The company is capitalized at \$50,000, and will carry on a general nursery business. The officers and directors for the first year are Emerson S. Mayo, Ray A. Mayo and George M. Pappert.

MOUNT VERNON, N. Y.—The firm of Dummert & Wagner was dissolved July 1, 1907, by mutual consent. Mr. Dummert will continue in the nursery and landscape business entirely with nurseries at Columbus avenue, Mount Vernon, N. Y., and office to be announced later. Mr. Wagner will continue in the plant and cut flower business with greenhouses at 137 Union avenue, store, 56 South Fourth avenue.

CANADIAN NOTES

OTTAWA, ONT.—We have Summer in earnest; for two or three days the thermometer registered 90 to 94 degrees—not what you would call pleasant for emptying rose houses. Spring planting business was away ahead of other years. Perhaps the fact that there is to be an old boys' reunion next month has stirred some up to make a display.

The demand was for scarlet geraniums for boxes, vases and beds; pink, salmon and white were not in it. Everything sold from 3 1/2 and 4 in. pots at \$1.50 per dozen. Coleus, cannas and salvia came next; coleus, 75c. to \$1 per dozen; cannas, \$1.50 and salvia, \$1 to \$1.50. All kinds of annuals were sold out at 25c. per basket (15 in. baskets). The demand for veranda boxes was greatly increased over former years, and for the last week we have all had to refuse orders, as it was impossible to get the material.

We have also had some large June weddings with big church decorations. These, coming in the middle of the plant trade, made things lively; but it is all over now and the building rush is on. All are building this year, but some of us are late in getting started.

Wright Floral Company have started on their new store building which promises to be a fine one.

Wright of Aylmer is getting the ground into shape for a new range; and Graham Brothers and Scrim's are getting ready to make additions.

Everything outside is catching up lost ground, but the Rose show had to be postponed until July 2. Peonies are coming in plentifully now. E.

LONDON, ONT.—Business is fairly good in the plant line, but rather slow in cut flower circles. The outlook is that the bedding plant trade will not be as good as a year ago, owing to the lateness of the season, a great many people are not planting out as much stock as usual. Gammage & Sons have about 3,000 geraniums on hand, also quite a lot of coleus, cannas, etc. This firm reports that geraniums A. Ricard and S. A. Nutt have led all other varieties. There has been a very large demand in this city this year for annuals in boxes—much better than for several seasons. The market is being flooded with carnations, the selling price being from 10c to 25c a dozen.

The London Horticultural Society intends holding its first flower show this season, on June 26 and 27. A good exhibition is expected.

The Canadian Horticultural Association convention is beginning to be talked up; the programmes will be ready shortly. A good attendance is expected and a good time is assured everybody who attends the convention in London this August. We hope to see a good attendance of our American brother florists at this convention. F. C.

BUSINESS DIFFICULTIES.

CINCINNATI, O.—An involuntary petition in bankruptcy was filed against the Albaugh Nursery and Orchard Company in the United States District Court June 28, 1907, says the New York Times. The petitioners, who are creditors for over \$10,000 charge that while insolvent the nursery company has transferred assets, and that uncontested suits for large amounts have resulted in undue preference of certain creditors. A judgment for \$23,795 was secured in favor of the Fourth National Bank of Dayton, Ohio, against which an injunction is asked until the solvency of the company can be determined.

Rose and Strawberry Show.
The rose and strawberry exhibition of the Massachusetts Horticultural Society, which was held at Horticultural Hall on June 29 and 30, while not up to the standard of former years as regards the quality of the rose exhibits, was nevertheless a very attractive show. The peculiar drawbacks of this season on account of the variable weather have so affected all of the exhibitions this year that it has been practically impossible to tell one week before hand what would be in bloom for a particular date. As I have said roses did not play as prominent a part in this exhibition as might have been expected, for peonies which have been exceedingly late this season, did a great deal to make the show attractive. The special features of the exhibition which deserve credit were the displays of peonies from E. J. Shaylor, T. C. Thurlow, the Blue Hills Nurseries; and the displays of hardy herbaceous flowers from the latter; from Frederic J. Rea and from R. & J. Farquhar & Company. Delphiniums were not nearly up to the standard of former years they being much later this year.

The principal exhibitors of roses in the prize classes were W. J. Clemson, Wm. Whitman, Aaron Ward, W. A. L. Bazeley, E. L. Lewis, Robert Leaver and H. R. Foote.

Those exhibiting peonies for prizes were Geo. Hollis, Dr. Chas. S. Minot, T. C. Thurlow Company, and James McKissock. First class certificates were awarded to James Cartwright for superior cultivation of *Oncidium spicatum*; to J. E. Rothwell for American seedling cypripedium *Emil Johansson*; and to James McKissock for new peony *Rosa Bonheur*. Honorable mentions were awarded to J. Lawson for culture of *Crassula*

coccinea; to Wm. Whitman for display of digitalis; to George Hollis for seedling peony George Hollis; to Dr. Chas. S. Minot for new peony M. Charles Levi-que; to F. J. Rea for Iris orientalis Snow Queen and to E. J. Shaylor for seedling peony.

There was a good exhibition of strawberries and vegetables which were well up to the standard notwithstanding the lateness of the season.

News Notes.

The outing of the Gardeners and Florists' Club in the Boston Parks on Saturday proved a failure as far as numbers were concerned, mainly on account of a misunderstanding in the notices. Those who took part in it were greatly delighted with their trip and only regretted that so few attended to get an opportunity of seeing and having explained to them the hardy gardening schemes which are being carried on in the Boston Park system.

Welch Brothers have been making improvements in the basement of their store where the supply department is situated. An entrance has been made from the sidewalk in front of the store and a wireworker installed so that now every facility is available for filling orders in all florist departments by this enterprising firm.

The vacation season has started in; among those absent this week we note Henry M. Robinson and Martin Wax both of whom will be gone for a month; a Europe-bound vacationist this week is Martin Touhy, a well-known retailer of South Boston.

The hailstorm which passed over Medford last week did much damage to crops; one of the worst sufferers was W. W. Rawson, who estimates his loss at \$4,000.

J. W. D.

Philadelphia.

News Notes.

The Florists' Club meeting on Tuesday last was a very lively one. Convention matters came in for a large share of attention and the suggestions for entertaining the S. A. F. members were numerous, so that the committees have a difficult matter to decide what to adopt. The question has now resolved itself into an outing to Fairmount Park or a trip to the seashore; at present the latter has the greatest support.

H. Bayersdorfer & Company are now receiving lots of new goods from abroad; they have a shipment of toneware in many new designs, also numerous new designs in baskets.

D. T. Connor, representing Lord & Burnham Company, in this city, has moved his office to room 722 Held Building, 1215 Filbert street.

C. J. Rainear & Company, iron pipe valves, etc., have offered prizes for the convention shooting contest.

Thos. J. Oberlin's paper on "The Redemption of the Hog-Backs," read before the club, at its last meeting, was well received; he had specimens of flowers on exhibition grown on the hog-backs.

DAVID RUST.

pany, at W. Peterson and North Forty-
eighth avenues, into a complete and thor-
oughly up-to-date range, now embracing
about one hundred thousand square feet
of glass, with a model combined office,
packing room and boiler house. This
Fall work will be commenced on an in-
crease in glass area of fifty thousand
square feet. The products are confined
largely to roses and carnations, which are
ranked among the high grade stock and
are sold mostly on annual or perpetual
orders, one case being mentioned of a
customer in a city in a neighboring
State to whom flowers had been shipped
every day for eleven years except a few
weeks last Summer when rebuilding caused
an interruption in the shipments. For
the season the stock in the houses is look-
ing remarkably well, and the carnations
in the field are fully up to, or rather
better than the average in this vicinity.

The American Association of Nursery-
men at the recent session in Detroit
praised the work of the National Council
of Horticulture and by the appropriation
of \$200 to aid the council set a more
practical seal of approval on the latter's
efforts, through the newspapers of the
country, to set before the people, read-
able, authentic, horticultural information.
James H. Burdett of the Daily Journal
editorial staff of this city who is in
charge of the newspaper part of the
council's far-reaching work, states that
the leading obstacle in the path of the
organization thus far has been to induce
well informed, reliable parties to write
notes on the desired subjects, the daily
and weekly papers very generally showing
not only a willingness but an actual de-
sire to publish the matter.

A meeting of the committees in charge
of the arrangements for the annual picnic
of the Florists' Club and friends, to be
held at Morton Grove on Sunday, July
21, met on Friday of last week and re-
ports of sub-committees indicate satis-
factory progress. Transportation ar-
rangements have been completed with the
C. M. & St. P. railroad, and the commit-
tee on sports has announced the follow-
ing list of events: Tug of war between
wholesale and retail florists; boys' races,
under 10 years and between 10 and 16
years; girls' races, under 10 years
(handicap) and between 10 and 16
years; baseball game between wholesalers
and retailers; sack race, married ladies'
race, young ladies' race, guessing contest,
fifty-yard dash for men and boys, fat
men's race (handicap), hop, skip, and
jump, running broad jump, one hundred
yard dash (Poehlmann Brothers Com-
pany employees only) and game of quoits.
Valuable and useful prizes are offered for
the successful contestants in each combat.
H. E. Klunder and John Zech will judge,
Charles Balluff announce, and John Deg-
nan and T. E. Waters start the events.

A fine exemplification of clean culture
in the nursery business may always be
found at the headquarters of Leesley
Brothers on Peterson avenue. They have
one hundred and ten acres in their tract,
about forty acres being devoted to the
culture of onion sets and the remainder
to a general line of nursery stock. One
of their specialties is an extensive col-
lection of named varieties of lilacs. One
field containing 100,000 Cornus sibirica,
weigelas, spiraeas, etc., set out this past
Spring is particularly noticeable for its
thrifty appearance with only here and
there a miss. Among the newer intro-
ductions observed were Weigelia Eva
Rathke, rugosa rose, Blanche de Coubert,
and Berberis Thunbergii japonica, a form
readily attaining a height of five or six
feet. Only what they consider among
the best peonies are grown by this con-
cern, their list now including about 25
varieties which may be increased to 40
but not more. A propagating house of
considerable pretensions is among the
probabilities of the near future for the
facilitation of the production of nursery
stock to fill the requirements of their
trade.

P. J. Hauswirth's new Auditorium
store is rapidly nearing completion. The
work on the icebox, which has been in-
terrupted, is now progressing favorably
and the box has assumed form and bids
fair to be a very handsome creation. It
is composed of vari-colored marble with
the greatest possible glass surface, con-
structed by Orr & Lockett and cooled
with the Kroeschell Brothers Company's
refrigerating apparatus with which the
hotel is equipped. Mr. Hauswirth will

Chicago.**News of the Week.**

Frederick Sperry left last Sunday
to spend the Fourth and a few succeed-
ing days with his father at Conneaut, O.
J. A. Budlong's family has erected two
Summer residences at Lake Geneva, and
A. H. Budlong's family and Mrs. J. A.
Budlong, with her father, Mr. Smith, are
now occupying them to remain during the
heated season. Mrs. Schupp and the
children will join them later, and A. H.
Budlong and Phil Schupp will spend as
much time as business will allow at this
beautiful North Shore resort.

E. F. Winterson last week bought an
entire house of Boston ferns from a Wis-
consin grower to be delivered as desired.
The lot includes many specimen plants.

F. F. Bentley, with several members of
his family, will shortly resort to Diamond
Lake for an outing, where he goes every
Summer to participate in the fine fishing.
Herman L. F. Lagercrantz, Swedish
minister to the United States, was a
guest of William A. Peterson at his home
on Peterson avenue, on Wednesday of
last week, greatly enjoying the beautiful
field display of peonies as well as the
superb cut blooms with which the house
was profusely decorated.

A. L. Vaughan is already making plans
for his annual outing at Spirit Lake,
ninety miles northeast of St. Paul, where
he will be accompanied by a boyhood
friend now located in New Mexico, whom
he has not met for twenty-five years, the
start to be made about the middle of
July.

Lou Coatsworth has a party formed
and arrangements completed for a trip to
Vancouver, thence into the mountains of
the great Northwest on a grizzly bear
hunt this Fall.

Marked improvements of comparatively
recent date have transformed the estab-
lishment of the Brant & Noe Floral Com-

Florists' Supply Price List on Application

St. Louis, Mo.

News Notes.

A. M. Augspurger of D. A. Augspurger, Peoria, Ill., was a caller the past week; also Mrs. A. C. Canfield of Springfield, Ill., James S. Wilson of Vaughan's greenhouses, Western Springs, Ill., and J. E. O'Neil of Vaughan's Seed Store, Chicago, were likewise callers; both gentlemen came down to attend the club's twentieth annual smoker last Saturday night. W. Nusbaumer, San Angelo, Tex., spent Saturday in the city and left for home that night, having spent two weeks at his old home in Oakville, Ill.

Carl Beyer is laid up with a badly sprained leg, which he sustained in a running match at last Sunday's picnic of the Rowing Club, of which he is a member.

Will Young reports that their head book-keeper, Miss Alice Scott, left the past week for a visit to Atlantic City, N. J., for her health. Miss Scott will remain there for a week, stay in Philadelphia during the S. A. F. convention, and return home with the St. Louis delegates.

A better rate has been given State Vice-President Young for the St. Louis delegates, who are to attend the S. A. F. convention next month; a fifteen-day stop-over trip, including a trip to the Jamestown Exposition over the Vandalia R. R. This new rate will be a most exceptional one for the members, and will be laid before them at the club meeting for approval.

Fred. Foster and his friends, John Burke and Alex. Siegel, are to have a chicken fry at the florists' picnic the 25th of this month, and all attending will be invited to partake of the feast. The chicken will be furnished by Black Jack, Foster's porter.

The youngsters in the florist trade have organized baseball teams; one is known as the Sander's Nursery team, captained by Edgar Sanders; and the other the Bentzen Floral Company team, John Bentzen captain. All the players are under fourteen years of age, and the trustees have put up a good prize for them to play for at the club's picnic.

The members of the Florists' Club should not forget the meeting on Thursday afternoon, July 11, at 2 o'clock in the rooms, Burlington Building. Nomination of officers will take place and a great deal of other very important business will come up for discussion. Convention matters will also be considered. President Irish has requested the secretary and trustees to make great efforts to have the entire membership out for this meeting.

A. Barnett, representative of Reed & Keller, New York, is with us this week.

The Club's Smoker.

The Florists' Club's smoker, given by the members to celebrate the club's twentieth anniversary on Saturday night last, was a most enjoyable affair. Everybody had a good time, and it was not until the small hours of the morning that the last of the boys left for home. Trustees Smith and Weber had everything in preparation and ready when the members began to arrive at 9 o'clock. When the entertainment commenced there were seventy-five florists in the hall. After serving refreshments and cigars, the trustees called upon J. J. Beneke to act as master of ceremonies. Mr. Beneke called upon President Irish to make the opening address, which no one can do better. Luther Armstrong responded, he being the club's first secretary. He spoke of its early days and referred with great feeling to those who attended the first meeting and who have since passed away. The chairman then called for music by the band and a few songs from the members. After a pleasant half hour of music and mirth, Ex-presidents Fillmore, Kunz, Guy and Sanders were called upon for a few remarks; all of these gentlemen were received with favor. More music and singing, then the speaker of the evening was called upon, Ex-president J. F. Ammann of Edwardsville. Mr. Am-

mann gave some good advice to the members, and also spoke on the welfare of the Florists' Club, the S. A. F. and the Illinois Florists' Association. J. S. Wilson of Western Springs, Ill., one of our first members, was then called upon, followed by W. C. Young, Frank Weber, John Connon, H. Lohrenz, S. Kehrman. Following these speakers came more refreshments, songs and witty sayings by Frank Fillmore, Jr. and F. Fillmore, Sr., J. J. Beneke, J. F. Ammann, Chas. Schoenle, George Augermiller and others. The pleasant affair terminated with the singing of Auld Lang Syne by the members.

ST. PATRICK.

Cincinnati, O.

News Notes.

L. H. Kyrk and wife have been enjoying a river trip from Cincinnati to Pittsburg and return. Quite a large party of church folks made this trip, which was very pleasant and restful. The balance of Mr. Kyrk's vacation will be spent with relations in the vicinity of Tiffin, O.

The Bankers' Convention held in this city at the Hotel Sinton during the past week helped the flower business in spots. Hardesty & Company having the decorations for the banquet. Sixty-five round tables and a square one were decorated, using sweet peas, American Beauty roses and foliage plants.

J. P. Ernsterhoff, Newport, Ky., one of the oldest florists of this vicinity, died suddenly Thursday evening, June 27, aged 78 years. Funeral services were held Monday, July 1.

It is reported that another veteran florist of Newport, Ky.—Uncle John Fries—has retired from business, and has turned over his greenhouses to his son Ed.

Albert McCullough, wife and two daughters sail soon and will spend several months abroad. J. Chas. McCullough has also set sail for foreign parts.

J. A. Peterson and wife expect to sail about July 15 for Denmark and other foreign shores. Look out for something new in plants when J. A. returns.

Chas. Weltz, Wilmington, O., was a caller during the week. Meyer Heller, wife, son and a couple of young lady friends, in their touring car, were here for a short stay last week. E. G. G.

New Orleans, La.

News Notes.

The business of A. Allost, Gentilly avenue, will hereafter be carried on by Mr. Allost's son and daughters, Mr. Allost having retired after many years of successful labor.

Ed. Baker was laid up the past week with lumbago but is able to move around a little now.

Mrs. Wm. Rehm is cutting fine asters from her Napoleon avenue establishment; she also has two houses of as fine ferns as one would wish to see among which are some well grown Cibotium Schiedel.

Plumbago capensis, both the blue and white varieties, having passed unharmed through the past few Winters, grow to be good-sized bushes, and as they bloom continuously from early Spring to late Summer are found to be very satisfactory subjects for city gardens.

James A. Newsham received a large shipment of Cattleya Mendelii from his collector during the past week.

CRESCENT CITY.

ROCKFORD, ILL.—H. W. Buckbee was in Chicago last week in search of ideas to be used in the reconstruction of his firm's store. Mr. Buckbee expects to tear out the present entrances on both Main and Wyman streets and in their place to put new and up-to-date fronts. The doors will be set in three feet to effect more window display. In the basement a first-class cold storage plant will be installed for the preserving of cut flowers, and on the first floor a new refrigerator will be set in.

WARE, MASS.—Arthur Howe of North Tonawanda, N. Y., is visiting friends here. He formerly lived in Ware, and is engaged in the florist business with his brother-in-law, Garnet Towne, who is also a Ware boy.

have more than double his former room including a model basement, part of which will be partitioned off for an office for the transaction of the proprietor's duties as secretary of the S. A. F. O. H. The wholesale houses will generally observe the five o'clock closing custom during July and August. W. K. W.

AMHERST, MASS.—Prof. Waugh has issued an illustrated leaflet setting forth the facilities of the division of horticulture as recently organized in the Agricultural college. It includes the departments of pomology, floriculture, market gardening and landscape gardening. Two years are devoted to the various branches of pomology, one year to market gardening and floriculture, and a half-year each to plant breeding and arboriculture. Forestry is taught by the state forester, Professor F. W. Kane. The equipment comprises 100 acres of fertile land devoted to orchards, gardens, an arboretum, forests, nurseries of all sorts and greenhouses. Wilder Hall contains classrooms and laboratories admirably adapted for the work. Modern tools, instruments and machines are supplied.

NASHVILLE, TENN.—Brown Danahy, a driver for Geny & Company, florists, was thrown from his wagon last week, and badly bruised up. His head came in contact with the curb stone and a long deep gash was cut back of the left ear. He was carried into a nearby doctor's office, where his wounds were dressed. The doctor stated that though the wound was deep and painful, the young man, however, will be out in a few days.

THE TRADE ONLY—When Writing Please Mention THE FLORISTS' EXCHANGE.

Elmira, N. Y.

The United States Cut Flower Company of this city is one of the foremost establishments in the entire country. New ideas, improved methods, and strictly up-to-date business principles have in part combined to make it so. This company was incorporated in 1903 with an authorized capital of \$600,000. W. R. Compton, is president, Mr. Loman, secretary and R. G. King, head grower and general superintendent. There are now 150,000 feet of glass devoted to cut flower growing. Forty thousand carnations are required to fill the benches allotted for this purpose. In roses 18,000 Brides and Bridesmaid are grown. There is in addition to this a house of 12,000 American Beauty, one of 2,000 Mme. Abel Chatenay and one of 2,000 Ivory, also a fine house of Richmond. Besides these there are usually grown about 18,000 chrysanthemums, 1,000 callas, some smilax, Asparagus plumosus and Easter lilies.

The output from these houses shipped to a list of about 60 regular customers that get a shipment about each alternate day. Nearly every city of importance in the State is represented from New York to Buffalo. A large space on the wall of the spacious packing room contains the name and address of all regular customers; each one in a neat panel of himself, at the bottom of which is a book that holds at least a dozen shipping tags with the name and address already written thereon. This is said to be very handy in case of rush orders. The packer has only to reach to the book and get a tag. The bookkeeper in his spare time keeps the supply at all times replenished for the constant demand.

When the building was first started the houses were erected by the King Construction Company. A still greater increase of growing space was required and this Spring an addition of 100 feet to the length of the 20 large houses was undertaken. The Lord & Burnham Company doing the present work. The greater part of the houses is now about complete, and while work was not commenced on them until April 17, a few of the new houses are already planted in roses. Mr. King thinks that it is remarkably quick work, and is very much gratified at having his new stock planted so soon. The houses intended for carnations will be ready in ample time, as well as a new 160 foot propagating houses.

The new houses all have raised benches with inch steel pipe uprights, and cross bars; the bottoms are of cypress and sides of oak.

In the older houses the benches are all solid, with a cement wall about 18 inches high surrounding each bed. The inside of these beds are filled in with any ordinary soil that may be convenient to a point about 10 inches below the level of the side walls of the bed. On this bottom is placed ordinary 4-inch tile, or drain pipes, running directly across the bed and laid as close together as they would fit. The ends of these pipes come through the side wall of the bench, flush with the outside. From this it will be seen the tile pipes must be put in place before the side walls of the bed is completed. Each of these pipes has a direct circulation of air under the bed. The steam pipes pass directly underneath them on either side of the outer bench walls. The heat from same passes through the tiled pipes directly under the roots of the roses. This causes the beds to dry out rapidly. Sprinkling or feeding can be done any time during bad weather without much fear of overdoing it, as might be the case in deep solid beds, about five inches of soil are required to fill the beds from the tile pipe up to the level of the bed.

The company has 110 acres of land for growing Summer stock as well as for the soil supply for the greenhouses. About 60,000 carnation plants are in the field.

John B. Rudy, late gardener to the Hon. J. S. Fasset, has joined the commercial ranks. He has recently finished a range of three houses, 100x20 feet and will make carnation growing his specialty. H. N. Hoffman has 30,000 feet of glass and grows mostly for wholesale. He has also a line of nursery stock. Outside of the United States Cut Flower Company he is the largest grower in the city.

Fred. L. La France has recently taken in some partners and had his place incorporated. It is now the La France Carnation Company. They will grow carnations for wholesale. This new company has several greenhouses all comparatively

new as well as several acres of land for the outdoor end of the business. Fully two-thirds of the benches are already planted with carnations from small pots; the remainder of the benches will be planted from the field later on.

F. W. Durand has a nice store and office building at 107 West Market street; he had also a greenhouse in connection, and is to add more soon for decorative plants. This is the old Grove P. Rawson stand. Mr. Durand is brother-in-law to the late Mr. Rawson and succeeded to the store and cut flower trade with which he was formerly identified in connection with his brother-in-law. The place is still known as the Rawson Greenhouses. George Backer and E. Orvis do a regular plant business. Owing to the late season all the Spring trade had been crowded into a few weeks that made it difficult to handle.

Robert M. Leavitt has an attractive city store. He has at all times a good stock on hand in cut flowers and decorative plants. J. M.

Syracuse, N. Y.

News Notes.

The parks have been very attractive with their displays of tulips, which are still in bloom and likely to last for a week yet.

Speaking of the parks, there is a general desire now to greatly extend these, and to construct a boulevard around the city. The cost, as just published, will be in the neighborhood of two million dollars. There is no question but this would be a great benefit to the city, but the great trouble here, as in many other places, the City Fathers fail to provide sufficient funds for the proper maintenance of these beauty spots, which makes the office of park superintendent anything but a sinecure. Every one is greatly pleased with Superintendent Campbell's success, considering the small appropriation he has.

The spirit of beautifying the city has stirred the trustees of the Syracuse University to ask for one hundred thousand dollars to lay out and improve the campus around the buildings. The university hopes in the very near future to possess a botanical garden. A beautiful place has been secured and Park Superintendent Campbell is doing all he can to help them. Already quite a number of plants have been collected.

Your correspondent has been confined to the house for the past month with a severe attack of the grip, and is still under the weather. H. Y.

WEBSTER, N. Y.—Mr. and Mrs. John A. Neubrand celebrated their golden wedding on Sunday, June 23, last, the event being observed quietly but most enjoyably, only immediate relatives being present. The couple, whose ages are 71 and 69, respectively, are held in high esteem in the community. The home, and especially the dining table, were very beautifully decorated. Two of the sons are florists by occupation in Providence, R. I., and Tarrytown, N. Y., and their contributions of flowers and skill added greatly to the elaborate effects. Mrs. Neubrand is an amateur florist herself, as is also her sister, Mrs. Witmer. A sumptuous dinner was served about 1:30 p. m. Mr. and Mrs. Neubrand received several fine remembrances in gold.

HOUGHTON, MICH.—The Lakeside Floral Company is busily engaged in its broad policy of expansion and ground has been broken for two important additions. One will be a new business house and conservatory in Calumet, and the other the doubling of the capacity of the greenhouses at Chassell. On Fifth street, Calumet, ground has been broken for one of the most artistic floral establishments north of Milwaukee. The new building, is intended to be erected along lines of a pretentious nature. It will be a replica of the Spanish mission, familiar to travelers in the Southwest, being made of stucco, and given a cloister effect by three arches. Two of these will be utilized as show windows and the third, in the center, will be a recessed opening into a tile floored vestibule. Adjoining the stucco will be a conservatory, 20 feet in width and 50 feet deep.

Growers' Problems Solved by U. G. Scollay.

I have a three-quarter span house, 20 feet wide and 120 feet long. There is a 5-foot double board wall on the north side and ends and a 3-foot double boarded wall and 2-foot continuous ventilator on the south side. The ridge is 10 1-2 feet above the ground. I will have two 2-inch flow pipes overhead and would like to know how many 2-inch return pipes will be necessary underneath the benches to maintain a temperature of from 55 to 60 degrees in zero weather. I will use hot water. Also let me know how large my expansion tank will have to be; give smallest size Long Island. H. S.

—You make mention that you will have two 2-inch flow pipes overhead. Now don't do it, for it is not enough capacity to carry the amount of surface that you will require under the benches. It will be best to have three overhead mains, two 2-inch, and one of 2 1-2 inches. Place under the south bench five 2-inch pipes, and connect them up to the 2 1-2-inch main. Under the center bench four 2-inch pipes with one 2-inch overhead main. The other 2-inch main can carry three pipes on the north side. This piping will give you a temperature of from 55 to 60 degrees in zero weather.

Your expansion tank should be about 16x48 inches or somewhere near forty gallons. I would advise a boiler of not less than 1,500 feet, 4-inch capacity. The calculations for the above surface are based on the fact that your boiler will be below the grade of the greenhouse. If it is not, write me further particulars regarding depth of pit, before doing anything.

U. G. SCOLLAY.

Ideal Concrete Machinery Company Again Enlarges

The Ideal Concrete Machinery Company of South Bend, Ind., have completed a deal for the purchase of the plant, business, patents, stock and good-will of the White Cement Machinery Company, of Jackson, Mich., thereby bringing into the "Ideal" family a number of machines that makes the line wonderfully complete, and will doubtless result in practical control of the concrete machine industry.

The simplicity and other merits of the former "White" machines for the manufacture of cement sills, steps, side-walks and posts, have made them famous for years among concrete block makers and contractors in all parts of the United States. These features appealed particularly to the Ideal Concrete Machinery Company, realizing as they did, that the addition of the "White" machines would make the Ideal line complete, universal and invincible.

The former "White" machines will hereafter be manufactured with the Ideal machines, and will be known as the Ideal Sill, Side-walk, Step and Post Molds. The recently enlarged manufacturing capacity of the Ideal Concrete Machinery Company places them in position to han-

due this increased volume of business without delay, and orders for the new Ideal machines will be filled as fast as received.

An elaborate catalogue has recently been issued by the Ideal Concrete Machinery Company, which to all intents and purposes is an encyclopedia on concrete block manufacture. It is sent free on application, and will prove interesting and valuable to builder and manufacturer alike.

LYNCHBURG, VA.—John Halliday, 88 years old, was instantly killed by a north-bound fast passenger train on the Southern railway in South Lynchburg on the evening of June 26. He was walking on the track and did not notice the approaching train. His head was crushed and both arms broken. He was a florist, an uncle of Halliday Brothers, Baltimore, Md., and leaves two daughters.

FAIRLAWN, N. J.—The Paterson (N. J.) Call of June 24 contains an interesting sketch of the career of George H. Peterson, rose and peony specialist of this place.

We argue that you can't afford to own an all-cypress house—it costs too much—the repairs eat too deeply into your profits. There's nothing new in our argument, but it's surprising why a man owning houses with end bar rot and half gone eave plates will keep putting up another and another such constructed house, when our Half Iron Frame Houses are so good, so practical, so much cheaper in the end. We want you to know exactly what is included in our Half Iron Frame House—tomorrow you'll be busy, so write today and we'll tell you all about it.

Cut open for a general view

This shows the cross channel and deep waterways

Rear section with interchangeable smoke box

LET'S get right down to the rock bottom of this "Burnham" boiler difference—how it actually differs.

Over the fire chamber and coming in contact with the gases when at their hottest, are deep water-ways, running entirely across the boiler; between these water-ways are funnel-like channels which pocket the burning gases and lead them across the boiler to the side flues and then—and not till then—do they begin the travel up and down the boiler three times before reaching the smoke pipe.

What do these channels amount to? They add tremendously to the direct fire surfaces—they lead the burning gases against the side water-ways, making them doubly effective. Doubly effective because they prevent the natural tendency of burning gases to draw toward the center, and start on their fire travel at once. This happens in other boilers, while with the "Burnham" you get the best out of the coal when the burning gases are at their best.

So the greatest difference in this "Burnham" Greenhouse Boiler of ours is the difference it makes in your coal bill. If you want that difference, write us.

A WEEKLY MEDIUM OF INTERCHANGE FOR FLORISTS, NURSERYMEN, SEEDSMEN AND THE TRADE IN GENERAL

Vol. XXIV. No. 2

NEW YORK AND CHICAGO, JULY 13, 1907

One Dollar Per Year

HYDRANGEAS

For Summer Blooming.

We have a magnificent lot of Hydrangea Otaksa grown especially for JULY AND AUGUST FLOWERING. The plants are just coming into bloom, just beginning to show color, and will be in perfection during July and August, when they are in great demand at watering places and other summer resorts. There is nothing showier or more satisfactory for lawn decoration. We make a specialty of them, and find an increasing demand for them from year to year. They can be shipped anywhere safely by freight.

Large plants in tubs, \$2.00 to \$3.00 each, according to size; Very large specimens, in half barrels, \$5.00 and \$7.50 each.

COBURN'S PANSIES

THE BEST MARKET STRAIN GROWN

We grow annually 500,000 transplanted plants for Spring sales. When in bloom we personally select about 10,000 of the finest for our seed beds.

As a result of such careful selection for a period of over twenty-five years, we have a strain which we believe cannot be equalled.

The plants are vigorous, compact growers, the flowers of large size, fine shape and substance, while the colors include rich selfs and brilliant and novel shades and markings in the widest range of colors.

We grow seed for our own use alone, usually planting our whole crop each year.

This season we have a small surplus which we have put up in trial packets of about 1000 seeds.

PRICE, \$1.00 PER PACKET.

Only one to each person, as the number is limited and we desire to distribute the seeds as widely as possible.

If you grow Pansies, try a packet. We invite comparison with any seed on the market.

Plants ready the last of August. Strong plants from seed bed, \$5.00 per 1000.

Cash with order.

I. E. COBURN,

291 Ferry Street,

EVERETT, MASS.

Seed Trade Report.

AMERICAN SEED TRADE ASSOCIATION

George S. Green, Chicago, Ill., president; M. H. Duryea, New York, first vice-president; F. W. Bolgiano, Baltimore, Md., second vice-president; C. E. Kendel, Cleveland, O., secretary and treasurer; Leonard Vaughan, Chicago, assistant secretary.

During the year 1906 Saxe-Welmar, Germany, exported to the United States seeds and plants to the value of \$66,467 as compared with \$57,880 in 1905.

EGYPTIAN COTTON SEED.—An American seed firm writes to the Bureau of Manufactures that it has an inquiry from a South American correspondent calling for several tons of Egyptian cotton seed.

FLAXSEED.—A New York firm writes to the Bureau of Manufactures that it has inquiries from Germany for flaxseed, and would like to secure the names of houses which could supply this article.

CHICAGO.—J. C. Vaughan left on Friday of last week for rest and recuperation in the Wisconsin woods expecting to be absent for a week.
Charles N. Page, of the Iowa Seed Company, accompanied by Mrs. Page, was in the city last week.

The Winterson Seed Store is laying in a full assortment of poultry supplies and accessories such as incubators, brooders, etc.

Charles P. Braslan was in the city last week on his way home from the American Seed Trade convention.

A. J. Pieters returning from New York to his home in California arrived in Chicago the first of the week.

Howard Earle passed through here on his way home from the Pacific Coast last week.

MITCHELL, S. D.—The first annual meeting of the stockholders and board of directors of the Dakota Improved Seed Company was held recently. The election of directors resulted as follows: L. R. Erskine, S. E. Morris, A. E. Hitchcock, I. W. Seaman, J. T. Morrow, A. A. Truax all of Mitchell, and Isaac Lincoln, of Aberdeen. The directors elected these officers: President, L. R. Erskine; vice president, J. T. Morrow; secretary, W. A. Wheeler; treasurer, S. E. Morris.

The company expects to erect a three-story building, covering a site, 70x124 feet. Contracts have been made for growing 400 acres of corn, 60 acres of oats, 40 acres of barley, 170 acres of flax besides many acres of smaller amounts. Secretary Wheeler said that he had made contracts with special vegetable growers all over the United States to produce vegetable seeds, and that after the receipt of the first crop they would be tested on the company's farm. The company hopes to be in full operation next year.

AMERICAN CORN IN HOLLAND.
—A recent consular report states "there is general complaint against American corn, and it has gone so far that some of the directors of the proof stations have advised against its purchase except in case of necessity. Dr. K. H. M. van der Zande, director of the station at Hoorn, stated to me that unless conditions improved he would publicly advise his people to refuse American corn. Many attribute the causes of improper loading and the methods used at some of the American ports. A prominent dealer writes me as follows: 'The worst corn reaches here during May and June and the cargoes from Newport News seem to reach here in worse condition than from any other port. The shipments from the Gulf have been bad, but how much this varies, however, is learned by the fact that last year all corn shipped from the Gulf was perfectly good, while shipments from Atlantic ports were nearly all damaged.' Despite the fact of the bad condition in which the American corn is alleged to arrive, the exports from the United States have steadily increased."

INDIANAPOLIS.—The building at 227 West Washington Street, occupied by the J. A. Everett seed store, has been condemned as unsafe.

European Notes.

Cold, wet and generally miserable, beating the record for the past 20 years in all these respects, Midsummer day has passed and left us still wondering when Summer will really begin. Only from Western France comes a word of cheer, for there a fine bright but cool day is sandwiched in between the prevailing dullness which marks the present year.

The effect upon our growing crops is not encouraging for while the frequent rains cause a free development of leaf and stem they do not appear to benefit the flower. In the case of peas this defect is very apparent, and in some of the districts where peas are grown largely for market the growers are using the plants for fodder; as a consequence, this vegetable is extremely scarce and fetches very high prices. The early sorts of peas, such as Alaska, Ameer and Caractacus, have suffered so badly that they are bound to fetch high prices next season. Gradus and Thomas Laxton were sown later and may yet survive, if the weather should improve in time, but if the sunless conditions prevail for another three weeks they will be

HENRY F. MICHELL CO.
1018 MARKET ST., PHILA.

PREPARE FOR CHRISTMAS

Novelties, always sell during the holidays. If you have not already grown them, try some Pink or Rose Speciosums. If potted in July, will flower for Thanksgiving and Christmas. Always useful either for cut flowers or plants. Ask the leading florists in Pittsburgh, Cleveland, Detroit, Buffalo, or around New York City. Order to-day. Will ship any time.

Cold storage Liliun looflorums and giganteums take about two months to bloom from time of potting; speciosums from five to six months, so that looflorums wanted for Thanksgiving and Christmas should be planted about Oct. 1, and speciosums in July.

All Cases are Re-packed Before Shipment

Liliun Looflorum Giganteum, 7 to 9-in. bulbs, 300 in case, \$9.00 per 100, \$8.00 per 1000.
Liliun Looflorum Multiflorum, 9 to 10-in. bulbs, 200 in case, \$11.00 per 100; \$100.00 per 1000.
Liliun Speciosum Robrum, 8 to 9-in. bulbs, 200 in case, \$8.00 per 100; \$75.00 per 1000; 9 to 11 in. bulbs, 150 in case, \$12.50 per 100; \$110.00 per 1000.
Liliun Speciosum Melpomeae, 8 to 9-in. bulbs, 200 in case, \$9.00 per 100; \$80.00 per 1000; 9 to 11-in. bulbs, 150 in case, \$12.00 per 100; \$115.00 per 1000.
Full cases sold at 1000 rate.

ARTHUR T. BODDINGTON, 342 West 14th St., NEW YORK CITY.

Cultural Directions

These are leaflets, each of which gives clear and succinct instruction how to grow and cultivate some particular plant, flower or vegetable; each subject has been written by an expert in that particular line, hence the information is thoroughly trustworthy and reliable, and any one of the leaflets can be handed by you to your customer with the full assurance that if he follow the instructions there given, he will be sure of success.

To the florist and seedsman who is dealing direct with amateur customers they are extremely valuable, and their cost is so slight that a leaflet can be presented with each purchase, thus furnishing the customer with full instructions how to care for and cultivate whatever plant, seed or bulb he may desire.

The following leaflets are particularly seasonable just now, and without a doubt your retail sales can be greatly increased by offering cultural instructions with all purchases.

500 Cultural Directions for \$1.50 { Printed on white paper, clear type, size 6x9 1/2 inches, in an assortment, your selection of not less than 100 of each, delivered carriage paid.

1,000 - - - - - 2.50
Sufficient space will be left at the bottom of each leaflet for your name, address, etc. If you desire this imprint (3 lines) we will put same on for you at 50 cents for 500, 75 cents for 1000. Special quotations will be made on quantities of 2500 "CULTURALS" or over.

A. T. De La Mare Ptg. and Pub. Co. Ltd.

Pubs. The Florists' Exchange.

P. O. Box. 1697, NEW YORK

in an even worse plight than the early round seeded sorts.

The reports from New Zealand are very unfavorable and judging by the latest reports in The Florists' Exchange the American and Canadian crops are equally poor.

Those who are holding good stocks of yearling seed should not be in any hurry to sell; they will pay for keeping.

Dwarf and pole beans make very slow progress; in southern France they are fully three weeks late and as a result the lettuces, and flower seeds which are often grown for seed between the rows of beans, are being seriously retarded in their development.

Spinach has grown almost out of recognition and is so full of sap that the work of harvesting will be doubly difficult. There will not be any very early deliveries of new crop seed this season, but, with favorable weather, the crop may be larger than usual. As stocks are exhausted this is very encouraging.

Turnip, rutabaga and rape are still

full of growth. A lot of canker has developed in rutabaga which, with the ravages of the flea, will still further reduce the crop; but for this we are prepared.

As regards flower seeds it is still too early to say anything very definite except perhaps that pansy is not only late but very short in breadth. The large acreage planted in the south last year, is, this year conspicuous by its absence.

Kund Gundstrup of Chicago was a recent caller on his way to Denmark.

CROMWELL, CONN.

Plant for Name.—Iris virginica, the native slender blue flag; it is sometimes known as I. prismatica or I. gracilis. D.

(1) Express Rates.—Will you let me know if the reduction of the express rates on cut flowers is to be general or only affects certain points and New York city, as I see by the article in The Florists' Exchange of May 11, that only a restricted locality is to be affected by the result of the ruling of the Interstate Commerce Commission. No reduction has been made between this place and New York city. A. T.

Boonton, N. J.

—The reduction in the express rates that went into effect recently, applies only to those localities where the rates had been advanced a year or so ago.

NURSERY DEPARTMENT.

Conducted by Joseph Meehan.

AMERICAN ASSOCIATION OF NURSERYMEN.
J. W. Hill, Des Moines, Ia., president; C. M. Hobbs, Bridgeport, Ind., vice-president; George C. Seager, Rochester, N. Y., secretary; C. L. Yates, Rochester, N. Y., treasurer.

SHERMAN, TEX.—J. S. Kerr, acting secretary of the Texas Nurserymen's Association, has announced the program for the eighth annual convention of that organization, to be held at College Station, August 23, 24 and 25, hours of meeting to be determined and announced each day of convention, as follows:

Welcoming address by Prof. A. F. Conradi, College Station; response and annual address by President E. W. Kirkpatrick; address by H. J. Adams, Schertz, Tex., he to choose his own subject; "The Increasing Demand for Ornamental Planting," J. B. Baker of Fort Worth and W. B. Munson of Denison; "The Spraying of Orchards and Nursery Stock—What, When, How," F. W. Mally of Nacogdoches and Professor E. J. Kyle of College Station; "Landscape Planning and Planting," F. T. Ramsey of Austin and Frank Brunton of Dallas; "The Detroit Convention of 1907 and the Lessons of the Hour," C. C. Mayhew of Sherman and E. W. Kirkpatrick of McKinney; report of the committee on revision of the Texas inspection law, with suggestions by members of the committee and others, John S. Kerr of Sherman, chairman; reports of other standing committees; election of officers.

The Well Doing of Retinisporas.

It is reported that in the Eastern States the retinisporas do well for some years, but do not retain their vigor after becoming of some size and age. So far as observed in the vicinity of New York and Philadelphia, there is no indication of going backward on the part of even the best specimens, and the owners of the trees are given no cause to fear any ill doing of the trees. There is one, *R. squarrosa*, which is rarely seen in perfect condition. A branch will die out here and there, disfiguring it. This is not so noticeable when trees are let grow as they will as when they are closely pruned. This retinisporea has a habit of holding its old leaves for many years, fostered maybe by close pruning, and when an outside twig dies the vacancy it makes displays a lot of dead foliage inside. Were less clipping done, the air and other causes would tend to make the dead foliage drop, rendering the loss of a twig here and there less noticeable. It is doubtless the density of growth, killing the foliage before it is ready to die naturally, that causes its persistency in clinging to the twigs.

Summer Pruning Evergreens.

When desired to make evergreens more bushy, Spring or early Summer is the time to do the pruning. Taking pines for illustration, when they make new growth it is usually in the shape of a strong leading shoot with four or five others clustered around it. To make bushiness result nothing more is required than to pinch off the central shoot. This stops the lengthening process, putting the vigor into the ones untouched, and if the leader of all the clusters is taken out it alters a straggling tree into a bushy one in one season.

All evergreens require the same treatment to make them bushy, let it be pines, spruces, firs or any other kind; and when the young shoots are formed and are plainly visible is the time to do the work.

Many pines, the white for one, left to themselves, will sometimes make a central shoot of several feet in length with no side branches. Pinching out the central shoot will bring the tree into line to become a beautiful, bushy, shapely specimen. If, in addition to stopping the central shoot, the ends of all other shoots are pinched out it adds greatly to the bushy condition desired.

Beautiful Weigelas.

Great improvement has been made in the weigelia family in the past few years, many of the dark flowered ones having been unknown in former times. The floribunda, Eva Rathke and like dark kinds, make a good display in collections of shrubs. But in

taking the genus as a whole, the fine one introduced to cultivation, rosea, still leads all others in the general estimation. The flowers are rose colored in the bud, showing white inside when expanded. There is a pleasing outline of growth to it which other sorts do not possess, some being of weaker growth, others much stronger, while it is of regular outline without any pruning. Nurserymen sell more of it than of any other sort.

An interesting and useful kind is one called *amabilis variegata*. The foliage is nicely variegated. Its flowers are rather lighter than those of rosea and because of this there is not the good contrast between them and the foliage which there would be were no variegation of the leaves present. On the other hand, after the flowers are past there is a beautiful variegated leaved shrub to give pleasure through the remainder of the season.

Weigelas are so easily rooted from both soft and hard wood that the sowing of seeds is rarely thought of. Yet they can be so propagated; and if seeds are from shrubs growing close together, seedlings will often differ from their parents.

Some Golden Leaved Trees and Shrubs.

Among trees and shrubs of a deciduous nature in nearly every case the golden color is at its best when the leaves are freshly developed. As the foliage becomes mature the golden shade loses its intensity.

Corylus Pontica Pendula, Weeping Filbert

Two pretty ones in early Spring are the golden-leaved catalpa and the golden philadelphus. The catalpa is at its best before the leaves are fairly unfolded, while the philadelphus gains color for some time later, as does, too, the golden elder, *Sambucus aurea*. All these golden-leaved ones are the better for good annual prunings. These prunings bring forth lots of young shoots, and the more of these there are the more golden foliage.

Two evergreens of great beauty at this time are the Douglas golden juniper and the George Peabody golden Arbor vitae. As they make fresh foliage their beauty is striking; and when in situations where other trees do not shade them they hold their golden color the whole year round.

In our hot Summer climate the George Peabody Arbor vitae is one of the best golden-leaved evergreens we have. It likes heat and light and moisture, and given these it rewards us with its graceful growth and golden adornment. It is an admirable evergreen to plant in pairs where such are desired.

Douglas's golden juniper is a golden form of what is called *Juniperus prostrata* in nurseries. Prostrata is but a form of communis. These, the green form and the golden, grow in a concave shape, and while making a spread of many feet add but little to their height. There are positions in which a low growing spreading evergreen is useful, and where one is wanted, try Douglas's golden juniper.

Corylus Pontica Pendula, Weeping Filbert.

There is always room in collections for new shrubs or trees of a weeping character, there being so many positions they fill to advantage where those of a non-weeping character would not fill nearly as well. And when the new comer is a beautiful one and uncommon, room is made for it more readily than for others. Such a desirable subject we have in the weeping filbert, *Corylus pontica pendula*. It is such a handsome appearing weeper that we had a photograph of it taken with a good deal of pleasure, the more so because it appears uncommon in collections hereabouts, though this may not be the case elsewhere.

As the illustration shows, this weeping filbert forms a very broad base, in this respect as well as in many others being unlike any other of the many weeping trees and shrubs. It more nearly resembles in its spreading habit the weeping beech than any other tree.

The nuts of this tree have the long husks that pronounce it a filbert. It is the presence or not of these long husks that makes either the filbert or the hazel. With them, it is a filbert; without them, a hazel.

The propagation of this weeping filbert would have to be by layering or grafting, as seedlings could not be relied upon to come true, though they might do so.

When filberts are allowed to grow as they will they form large bushes. In the case of this weeper a good height is attained quickly by staking a strong leader, as

has been done with the specimen photographed. Being a weeper it would be a long time otherwise before it reached the ordinary height of a filbert, the branches desiring to droop instead of ascend.

The specimen pictured is on the grounds of Mr. John T. Morris, at Chestnut Hill, Philadelphia.

Memorial Trees.

On the grounds of many lovers of trees are now to be found memorial trees—trees set out to commemorate the birthdays of members of the families or the visit of some friend, or other occasions, which the date of the planting will bring to mind. The grounds of the late George W. Childs, at Bryn Mawr, Pa., contained many such trees, chiefly to commemorate the visit of some notable personage. It is a very praiseworthy custom, and one which would be followed oftener than it is were it brought to the attention of the owners of grounds. Where there is a family of children and grounds are extensive enough, it usually requires but the attention of the parents to the matter, the desirability of it striking them at once. On the part of the nurseryman or florist it would mean many a sale. The custom of growing a few trees and shrubs in pots which is now so general in nurseries admits of a plant being available at any season of the year, even in Winter, for the date being known, the hole, soil, etc., can be prepared in advance of freezing, protected in some way that no hindrance to the planting may occur.

JOSEPH MEEHAN.

Analyses of Rose Soils.

There is no greenhouse specialty which requires so much skill as the growing of roses, and the magnificent specimens which may be found in the markets at almost any season of the year surpass all other greenhouse products in beauty and perfection. There is no plant which requires so heavily manured a soil as the rose. The customary formula for mixing such a soil is one-third finely pulverized sod, one-third loam and one-third cow manure. In addition to this, some form of commercial fertilizer is occasionally applied. Watering the plants with a strong decoction of cow manure is frequently practiced.

It is highly impracticable to use a soil of this nature for two consecutive seasons, since, owing to its high state of fertilization and the subsequent chemical changes which take place in the soil, a toxic effect is produced upon the plants. No class of greenhouse specialists is more particular about the

texture of the soil employed than rose growers, especially when growing the American Beauty. American Beauty are more susceptible to differences in soil texture than other varieties of roses, and a perfectly satisfactory soil for their growth has not as yet been found in this State. They require soil of a different texture from Bride and Bridesmaid.

The rose soils in the list (Table V.) were obtained from various sources, some of which are noted for their production of excellent roses; while others are prospective rose soils,—that is, soils sent in by rose growers who wished to ascertain whether they were well adapted to the growth of roses. It will be noticed that most of these analyzed rather high in very fine sand and silt, while two of the samples contained nearly 10 per cent. of clay.—From Nineteenth Annual Report of Massachusetts Agricultural Experiment Station.

Table V.—The Mechanical Analyses of Some Rose Soils.

CANADIAN NEWS

TORONTO, ONT.—Business during the last few weeks has been very lively. Those handling bedding plants, nursery stock, seeds and garden supplies have all been as busy as possible, working early and late trying to keep up with their trade. The warm weather came so late that when it did arrive everything was wanted at once, and so far as I can see the only reason that all stock is not cleaned up is, that it could not be handled quickly enough, and in many cases customers got tired waiting. Even now there is a fair call for bedding stock. A great many of the growers are quite cleaned out, but others have still stock around.

The demand for dark red geraniums has exceeded the supply. There has also been a very lively demand for Salvia splendens, and quite a call for ornamental stock; several beds of rather choice plants have been planted here this season. Large numbers of tuberous begonias have also been used. The backward season has been rather against rapid growth of tender stock, but most of it is now pulling up, and a few more days of warm weather will soon bring things to their normal condition.

Quite a number of the trade are disappointed with their European importations this season. Most of the Belgian palms arriving are very small and rather poor in quality. This, with the duty of 20 per cent. lately added by our government, makes them come high, and they are not likely to be sold nearly so cheap this season as they were last.

Cut flowers have been plentiful, and trade generally in them has been fairly good; all appear to have had a share in what was going. A good many have got their roses planted. Most of them have planted their chrysanthemums; in many places the latter are rather later than usual, as they are often planted after the bedding stock is out.

Carnations in the field are generally looking well, but in some places want a good rain to start them going.

The Toronto Horticultural Society had its annual excursion on Thursday,

CANNAS

Strong plants from 3 1/2 in. pots (30 named varieties) \$6.00 and \$8.00 per 100.

Double and Single in variety, \$7.00 per 100.
Ivy Leaved, \$7.00 per 100.

July 4. The members went to Niagara Falls, and spent the best part of the day with our old friend, Roderick Cameron, among his fine collection of herbaceous plants.

Walter Muston, manager of the Toronto Floral Company, while running in a race at a local picnic, fell and dislocated his shoulder. I am pleased to say he is nearly all right again now.
T. M.

MONTREAL—The Spring bedding trade was the best yet. Although the season was very late, there was a tremendous rush when the weather became warm; all kinds of plants sold out clean, geraniums heading the list.

The usual Summer dullness is on. Steamer orders and funeral work provide about all there is to attend to—orders for the former are sometimes difficult to fill, owing to the scarcity of real good quality stock. Roses are becoming smaller every day; peonies are plentiful but will soon be over.

F. L. Girdwood has had a large cut of peonies.

J. Bennett is busy remodeling a couple of houses prior to taking a trip to England.

C. Campbell is on his way to Scotland; he will be gone about two months.

P. McKenna & Son will open a new store in Bennett's theatre block shortly; this location is very central.

Hall & Robinson have been busy with orders for outgoing steamers; they also report a few belated wedding orders.

The Florists' Club picnic will be held July 24 at Highgate Springs, Vermont.
W. C. H.

Hail News.

POUGHKEEPSIE, N. Y.—A terrific hail storm struck Dutchess county Sunday last, and spent its fury largely in Red Hook. It began by smashing 750 panes of glass in the greenhouse of William Mead, completely wrecking the plant so far as the glass was concerned.

The storm peppered with merciless force one of the finest apple sections in this locality and it is certain that the orchards suffered greatly.

Saturday a similar storm struck Staatsburg and spent its fury in that vicinity. It smashed greenhouse glass in all directions and beat down the crops.

THE WEEK'S WORK.

Timme's Timely Teachings.

Calceolarias.

Last season proved an especially favorable one for herbaceous calceolarias, and what we were able to show in this line of greenhouse plants during the months of March and April, with a scattering few of the latest away into May, was probably the best of any we ever raised. Few other things at that time prove so great an attraction to patrons and visitors as these "fishermen's baskets" as some of the people persist in calling them.

A favorable season alone, of course, does not invariably bring success with calceolarias. Splendid plants have often been grown in spite of untoward conditions beyond our control. A good strain of seeds to start with is one of the first things to make sure of, and taking good care of the seedlings when in their first stage of growth is of equally great importance, the final outcome mainly depending on this.

The seeds of herbaceous calceolarias should be sown in July, the last two weeks of the month being the most propitious for the start. Pottery made seed dishes are to be preferred to wooden trays. When filling these with soil we begin with a layer of well broken up turfy old sod; place on this a few handfuls of very porous, sandy loam, fresh and sweet, and finish off with a thin surfacing of the same, finely sifted. After all this is nicely evened and properly firmed and a good watering has settled the soil still more, we scatter the seeds thinly over the surface of the pans and cover these with panes of glass. At this season an outdoor frame of some depth is a better place for the seed pans than the coolest of greenhouses. The sashes must receive a heavy coating of whitewash, or be covered with frame shadings and elevated above the bed to a fixed height of about two inches all around as long as the weather remains tranquil and fine. Sub-watering, that is, placing the pans in shallow water and allowing the moisture to saturate the soil from below, as practiced in the case of fern spores, is a better way here also in keeping the soil moist than watering the seeds or the little plants with a can from above.

The panes of glass laid over the pans are removed when the seeds are up, the pans, however, to remain in the frame. Shading is necessary during all the bright hours of every fine day, and two sets of sashes, the one whitewashed and the other clear, come very handy in trying to be just right in this particular. The lack of light and sufficient air is as certain to bring on destruction of the young seedlings as the glare of the sun's rays. An early pricking off into other pans is advisable as a safeguard against loss from damping off, and the same kind of soil as was used before, but sweet and freshly prepared, should again be used, also in the first potting up. But in later shifts, after the 4-inch pot has been reached, a full fifth of the prepared compost should be decomposed horse or cow manure, but the mixture at all times must be porous, sandy, nicely broken up but not thrown through a sieve.

Mignonette.

Very good mignonette for cutting from New Year until Spring may be raised from seeds sown as late as the last week in August. But the best mignonette I ever raised or rather the crop which paid best resulted from a sowing made on the sixteenth of July. This may seem somewhat early, but if first-class spikes must be raised for a first-class market and they are more likely to bring a good price in the early part of the Winter than at any time later in the season, one can confidently count on an early start as the proper thing.

Mignonette bears transplanting but not well enough to be practiced without causing a lasting setback in its growth a thing especially to be avoided in all cultures where rapid, uninterrupted headway from the very start amounts to everything in bringing about a satisfactory finish. Even where the seeds are started in pots and the plants transferred from these to benches later on, a course often followed, a great check in their growth is noticeable and the yield very often is not up to what it

otherwise would have been in point of excellence. If benches or beds can be got ready now a good start is assured. Use the richest kind of compost; firmly pack or pound it down; sow in hills from ten to twelve inches apart each way, five or six seeds in a hill pressed into the soil, water thoroughly and thin out the plants when several inches high, leaving the strongest one only.

As yet I have noticed but few of the common white and yellow butterflies, but no doubt they will soon be around in greater numbers depositing little patches of minute eggs here and there on the under side of the foliage of fast growing plants, preferably mignonette. These eggs hatch out in a few days, the result being a lot of little green worms, greedily eating their way from plant to plant. If present in a bed of young mignonette the destruction will be great. Remedies are a timely removal of every leaf showing egg deposits; powdered hellebore blown through the plants, and hand picking of the worms, difficult and tedious in the extreme. A good plan is to avert all this mischief by nailing up with cheesecloth the ventilating openings of a house stocked with mignonette, which will keep out the butterflies. The house chosen for the purpose should be one in which good carnations could as well be grown—not the coolest in the range either. Mignonette stands a low temperature and is only too willing to take it easy in 40 degrees and lower; but that is not what is wanted. The finest spikes are cut from plants grown without the least break in steadily progressing sturdy growth, and no time is lost in profitless idling and waiting for results. From 45 to 55 degrees is the right temperature for mignonette in the Winter, with plenty of tempered fresh air on bright days, and an ample allowance of moisture at the roots.

Of the various varieties suitable for indoor forcing Goliath and Defiance are the best for Midwinter and do especially well on solid beds; while the older Machet will bring its best crops in early Spring and can be grown on raised benches with fair success.

Primula obconica.

Seeds of *Primula obconica*, sown in January or February, as advised, will result in flowering plants of marketable size by next Winter, though they will only be at their best in the Spring. Exceptionally fine plants in full bloom, choice stock for the Winter following next, is had by making a sowing now. The seeds are started in the usual way in trays, merely pressed into the soil, not covered with earth. When the seedlings are well above the ground a transplanting either into other boxes or small pots takes place. Light and air are essential to the wellbeing of small primulas and should be given them in a more generous measure than is usually the case. During the Winter the plants remain in small pots and are kept rather cool. The next shift into larger pots is given near the end of February, to be followed by others from time to time until in the beginning of September they are transplanted for the last time. A frame out of doors, shaded against too much sun heat and protected from heavy rains by raised sashes, is the better place for the plants during the Summer months. They will be much sturdier if taken out of pots in May, planted into nice soil in a frame and again potted up in August. In that way fine specimen plants are grown, but great care is necessary in watering so as not to overdo it, which would bring on a yellowing of many of the leaves. Sufficient room between the plants must also be figured upon in setting them out. In the Winter when they are coming into bloom, a temperature of about 55 degrees should be maintained.

Cyclamens.

Of as great importance as the before mentioned and, indeed, one of the best of florists' greenhouse and market plants is the cyclamen. It also admits of being brought to a state of perfection mainly due to earliness in starting the seeds, a course much more to be relied upon for exceptionally fine results than a dallying with old overgrown corms. Seeds sown now, or not later than the first week in August, germinate quickly and grow into smart little plants, ready to undergo the first transplanting either into other trays or into little pots, by about the first week in November.

Small FERNS for dishes in A1 shape. \$3.00 per 100, \$25.00 per 1000.

JOHN BADER, MT. TROY, ALLEGHENY, PA.

Then in a temperature of from 55 to 60 degrees the seedlings will advance sufficiently rapid to make a shift into larger pots necessary in the latter part of February, this now to be followed at shorter intervals by others until, in somewhat over a year from now, they are transplanted for the last time.

For seeds and seedlings a light, porous soil, made up of leaf mold and easily crumbled, turfy sod compost, should be used with a goodly portion of decayed manure added for older plants. A good way of sowing the seeds is dibbling or pressing them singly into the soil at equal distances. Shading quite dense at this season, is necessary, but when the plants are up and beginning to show appreciable leafage, the sun getting lower every day and steadily losing in fierceness, a lighter shading will suffice and this should only be made use of for five or six hours on sunshiny days. Light as well as air, both so cheap and yet so helpful in our efforts to grow fine plants, should never be needlessly withheld, and much of our stock would fare better were we less anxious to shield it from imagined dangers.

SAVE GREENHOUSE FUEL

WITH the Ideal Concrete Block Machine, any florist can build his own greenhouses at little cost. Saves in fuel, because the hollow block is practically frost-proof. Lowers insurance rates and ends the cost of maintenance, because Ideal Blocks are fire-proof and everlasting.

IDEAL Concrete Machine

The original and only perfected Concrete Block Machine working on the face-down principle.

ENABLES the manufacture of Ideal Concrete Blocks from sand, gravel and a little cement at a cost far lower than that of other building materials. May be operated by any man without previous experience. Low in cost, rapid in operation, and can never wear out or break in use.

WRITE for catalogue and illustrations of Ideal Concrete Block construction, of practical value to every florist. Sent Free.

IDEAL CONCRETE MACHINERY CO.**Dept. Z,****South Bend, Indiana.**

FOUNDED IN 1888

Weekly Medium of Interchange for Florists, Nurserymen
Seedsman and the Trade in General

Exclusively a Trade Paper.

Entered at New York Post Office as Second Class Matter

Published every Saturday by the A. T. De La Mare Ptg. and Pub. Co., Ltd., Proprietors, 2, 4, 6 and 8 Duane Street, New York. A. T. De La Mare, president; Jas. H. Griffith, secretary; David Touzeau, treasurer; Alex. Wallace, editor. The address of the officers is the address of this paper.

P. O. Box 1697. Telephone 3765-6 Beekman.
CHICAGO OFFICE: 127 East Berwyn Avenue.

ILLUSTRATIONS.

Electrotypes of the illustrations used in this paper can usually be supplied by the publishers. Price on application.

YEARLY SUBSCRIPTIONS.

United States and Mexico, \$1.00. Canada, \$2.00. Foreign countries in postal union, \$2.50. Payable in advance. Remit by express Money Order, Draft on New York, Post Office Money Order or Registered Letter.

The address label indicates the date when subscription expires and is our only receipt therefor.

REGISTERED CABLE ADDRESS:
Florex, New York.

ADVERTISING RATES.

One-half inch, 75c.; 3-4 inch, \$1.00; 1-inch, \$1.25. special positions extra. Send for Rate Card showing discount of 10c., 15c., 25c., or 35c., per inch on continuous advertising. For rates on Wants, etc., see column for Classified Advertisements.

Copy must reach this office by 12 noon Wednesday to secure insertion in issue of following Saturday.

Orders from unknown parties must be accompanied with cash or satisfactory references.

Work of American Peony Society.

The intense interest shown by the members of the American Peony Society in the work they have in hand foretells the realization of practical results that will prove of immense benefit to the florist and nursery trades, not only of America, but throughout the remainder of the civilized world. To clear up the confused nomenclature of the peony would seem a hopeless task, when one considers the Cornell check list of upward of 2,700 names, and that it can be done only by concerted systematized method, covering a considerable period of research and observation, is an obvious fact.

A considerable portion of this work has already been accomplished in the test fields of the State College of Agriculture at Cornell, but there remains a vast amount yet to be done, and to the finishing of this work the greater efforts of the American Peony Society will be devoted during the next two or three years.

The plan for each member to select what he considers the best 100 of his varieties and forward one strong plant of each to the Cornell test plot should bear good fruit, and undoubtedly will prove to be the first tangible step toward selecting a moderate sized list of peonies that will cover the best in each class and type, as well as the different habits and seasons of blooming.

The peony is certainly a rich subject for the amateur, and the society is not overlooking the amateur's interests. Liberal prizes will annually be offered in the amateur classes and this section of the peony exhibit should be one of the most attractive features of these shows.

As yet the American Peony Society has not devoted much attention to advertising the merits of the peony to the general public. In the opinion of the leading members of the society this can best be accomplished through substantial exhibitions at the proper season in various parts of the country. Here would seem to be the opportunity for the local florists' clubs to demonstrate their usefulness by encouraging and holding such exhibitions, which can be made as attractive as any chrysanthemum show.

The example of President Ward immediately donating all the premiums awarded him to the society's general fund is one well worthy of imitation; and so long as its members show such enthusiasm as this the association's treasury will never run dry, and the full accomplishment of the work it has in hand is a foregone conclusion. C.

BOOKS RECEIVED.

MENDELISM by R. C. Punnett, Fellow of Gonville and Caius College, Cambridge, Eng. Publishers, The Macmillan Company, New York. Price 80c. Illustrated.

In modern times there is probably no study connected with plant and animal breeding that has received greater attention at the hands of both practical and scientific men than that of Mendelism. The great interest in this subject may be gleaned from the statement that although less than two years have passed since the first edition of Mr. Punnett's little book appeared, much of what was then written is already out of date, necessitating the writing of this, the second edition of the work. And there is contained within the 84 odd pages of this book one of the most succinct and informative expositions of this all-absorbing "law," theory, or whatever title best suit it, that it has been our privilege to peruse. The subject matter is treated in a not too technical manner or to be beyond the grasp of the ordinary reader, and it is scientific enough to suit all the purposes which scientists may demand of it.

The aim of the author is to give a brief account of Mendel's work with its more recent developments, and to touch upon some of the general consequences that flow from his experiments.

The founder of Mendelism, Gregor Johann Mendel, was born on July 22, 1822, at Heinzendorf, near Odrau, in Austrian Silesia, where his parents were peasants. In 1843 he entered as a novice the Augustine Convent at

Gregor Johann Mendel

Founder of Mendelism.

Altbrunn and was ordained a priest in 1847. Mendel was a teacher of natural science in the Brünn Real-school from 1853 to 1868, when he was appointed abbot of his monastery. He became interested in the problems of hybridization, and on his return to the cloister of Brünn commenced his classic experiments on the edible pea—*Pisum sativum*. The results appeared as a paper in the Proceedings of the Natural History Society of Brünn, under the title "Experiments in Plant Hybridization." Besides this paper Mendel contributed very little to biological literature. Nevertheless, it is known that he devoted much of his time to similar work on other plants. In a series of letters to Carl Nägeli, the botanist, he gives an account of his pea experiments, and also of others dealing with lychnis, thistles, etc. Nägeli, however, like the rest of his contemporaries who knew of Mendel's work, was unable to appreciate the magnitude of the discovery. Perhaps Darwin alone could have valued Mendel's little pamphlet at its proper worth, and into his hands unfortunately it never fell. Mendel died of Bright's disease in 1884 at the age of 61.

For five-and-thirty years Mendel's work remained unknown. It had appeared at an unfavorable moment. Six years previously Darwin's views on the origin of species had been given to the world, and men of science were beginning, eagerly to explore the new fields which he opened up. Hybridizers there had been before Darwin, but for lack of a central clue their results appeared as an inconclusive and disappointing tangle. Yet it was

this very clue that Mendel's work supplied. With the advent of the "Origin of Species" men regarded as settled the question which the hybridizers had striven to answer, and directed their energies into other and more promising channels. Of late years doubts have been cast upon the all-sufficiency of natural selection in the production of new species. A revival of interest in these matters on the part of a few biologists led in 1900 to the re-discovery of the principles of heredity which Mendel had clearly enunciated nearly forty years before. To gain an idea of the scope of these principles one cannot do better than turn to Mendel's own account of his experiments.

In the selection of a plant for experiment Mendel recognized that two conditions must be fulfilled. In the first place the plant must possess differentiating characters, and, secondly, the hybrids must be protected from the influence of foreign pollen during the flowering period. In *Pisum sativum* Mendel found an almost ideal plant to work with. The separate flowers are self-fertilizing, whilst complications from insect interference are practically non-existent. As is well known, there are numerous varieties of the edible pea exhibiting characters to which they breed true. In some varieties the seed color is yellow, while in others it is green. In some varieties the seed are round and smooth when ripe; in others they are wrinkled. Some peas have purple, others have pure white flowers. Some peas again, when grown under ordinary conditions, attain to a height of 6 to 7 feet, while others are dwarfs which do not exceed 1½ to 2 feet. Mendel selected a certain number of such differentiating characters, and investigated their inheritance separately for each character. Thus in one series of experiments he concentrated his attention on the heights of the plants. Crosses were made between tall and dwarf varieties which previous experience had shown to come true to type with regard to these characters. It mattered not which was the pollen-producing and which the seed-bearing plant. In every case the result was the same. Tall plants resulted from the cross. For this reason Mendel applied the terms "dominant" and "recessive" to the tall and dwarf habits respectively. The next step was to collect the seeds thus formed and to sow them in the following year. When this was done it was found that both tall and dwarf plants appeared in the offspring. Each individual was either tall or dwarf, and no intermediate appeared. Thus in one series of experiments Mendel obtained 1,064 plants, of which 787 were tall and 277 were dwarfs. That is to say, the tall plants were almost three times as numerous as the dwarfs. In other words, the dominant and recessive characters occur in the second generation of hybrids (F-2) in the proportion of 3:1. (For convenience it is customary to denote the hybrids arising from a first cross by the letter F-1 (equals 1st filial generation). The successive generations arising from this F-1 generation are denoted by the letters F-2, F-3, etc.)

In the following year the seeds of this generation (F-2) were sown as before. From the seeds of the dwarfs came only dwarfs, i. e., the recessive character bred true. The tall plants, however, were not all of the same nature. Some of them produced seed which gave rise to tall plants only. Others, again, formed seed from which sprang both tall and dwarfs in the proportion of 3:1. The tall plants of the F-2 generation were of two kinds, viz., those which carried both the tall and the dwarf characters. The former we may for the present call "pure," and the latter "impure" dominants. Thus in one experiment plants were raised from the seeds of 100 tall plants of the F-2 generation. Of these 100 plants, 28 produced seed giving tall plants only, whilst 72 yielded seed which gave rise to both tall and dwarfs. Hence, of the 100 tall plants tested in the F-2 generation 28 must have been pure for the tall character, whilst 72 must have been carrying the dwarf as well as the tall character. The former numbers, 28 and 72, do not make a very exact approximation to the ratio 1:2. The numbers, however, are small, and the proportion is greatly affected by a slight deficiency on either side. From a much larger number of similar cases (between one and two thousand) Mendel found the ratio 1:2 borne out almost exactly. The dominants therefore which come in the F-2 generation are of two kinds—pure and impure. On the other hand, the dwarf recessive always breed true in whatever generation they appear.

By breeding subsequent generations Mendel showed that the pure dominants and the recessive always bred true, resembling in this way the original parents. The impure dominants, on the other hand, always gave dominants and recessives in the constant proportion of 3:1. Since the pure dominants are only half as numerous as the impure dominants, it follows that the impure dominant, on being selfed, produces as offspring pure dominants, impure dominants, and recessives in the proportion of 1:2:1. And this held good for all impure dominants, no matter in what generation they were bred.

We have considered the case of one pair of characters only, but Mendel showed that the rule holds good for all the various pairs of differentiating characters studied by him. Wherever there occurs a pair of differentiating characters, of which one is dominant to the other, three possibilities exist. There are recessives which always breed true to the recessive character. There are dominants which breed true to the dominant character, and are therefore pure. And thirdly there are dominants which may be called impure, and which on self-fertilization (or in-breeding where the sexes are separate) give both dominant and recessive forms in the fixed proportion of three of the former to one of the latter.

The author gives the general results of the experiments, as well as experiments made subsequent to Mendel's time on animals and plants. For the practical plant breeder this little book will be invaluable, as the following out of its teachings in the case of certain kinds of plants at least, will obviate the haphazard crossing now carried out, and enable him to reach the goal for which he is striving in a much shorter period, the results being at the same time surer.

The book can be supplied by this office.

OUR READERS' VIEWS

The Work of Professor Hansen.

Editor Florists' Exchange.

I am here in Minneapolis to attend the Summer meeting of the Minnesota Horticultural Society, and have just returned after having had a delightful visit with my old friend, Professor Hansen of Brookings, S. D., who is the "Wizard of the North." No man is doing more to develop the agricultural and horticultural interests of the great Northwest. He has made three trips to Russia and Siberia, and in short, is searching the world for things of merit. He has brought out the sand thorn of Siberia—called the Siberian Buffalo berry, as it belongs to the same family—having much the same blossoms and bearing an immense amount of fruit which is much prized in Siberia for jells and jams. Two years ago he sent me some of the plants, which show great vigor and give promise of usefulness. He has also secured a mountain ash which has edible berries of large size, and we hope they will give an addition to our fruits as well as additional ornament. He has done much to develop the wild sand cherry of the plains, and by careful selection, and by rejecting thousands of plants, he has secured some of real merit. He has made a promising cross of the sand cherry and Prunus Simoni, of which he has great hopes. Prunus Pissardi is not hardy in the West, but he has crossed it with the sand cherry, and put the color of that showy plum on a beautiful and hardy shrub, which will be quite an addition to the ornamental shrubs of the West.

He went to Manitoba and secured the native raspberry, which he has crossed with Shafer's Colossal, securing one of the hardiest plants in existence. He says he does not want a strawberry that cannot stand 40 degrees below without mulching out on the bleak prairies of Dakota. So he crossed the hardiest of the wild ones with the best of our domestic berries. He threw away hundreds, but finally found some that would stand everything.

He has just received native strawberries from Alaska with which to continue his experiments.

The Niobe willow, named by himself, is the weeping form of the Russian Golden. It is very thrifty, as well as hardy, and promises to be of much value as a single specimen or as a hedge on low ground.

On his last trip to Siberia he followed the native alfalfa to its extreme northern limit in those semi-arid regions. The seed has germinated well and gives promise of success in our own dry northern regions.

The professor also secured several barrels of potatoes such as are used in Russia for the manufacture of alcohol, and is testing them at several stations.

Professor Hansen was born in Denmark. He is now in the prime of life and is just beginning his great work; in fact, he has just got a good start. Burbank has done great things for California, but nothing for the cold North. He and Hansen are great friends, working along different lines. But the "Wizard of the North," if spared, will do a work which will bless coming generations.

York, Neb. C. S. HARRISON.

Peonies.

Editor Florists' Exchange:

Permit me to call your attention to an error in your report of the proceedings of the recent meeting of the American Peony Society at Ithaca. I did not state that Floral Treasure and Delicatissima are identical, but called President Ward's attention to the fact that he claimed Floral Treasure (another leading seedling put out by the raiser of Golden Harvest) to be the same as Delicatissima, and asked him for the origin and authenticity of the latter variety. This Mr. Ward admitted he could not answer. Personally, I have never been able to establish the birthright of Delicatissima. Incidentally, the trial grounds at Ithaca show two absolutely distinct flowers under the latter name.

My comparison of Golden Harvest and Jeanne d'Arc was made in an effort to impress upon the society the importance of exercising jurisdiction in the matter of introducing new varieties. The next few years will doubtless bring forward a good many new varieties from American growers—I may have some myself—and I do not think anyone is really competent to judge of the merits of his own productions. He will have no trouble in discovering their merits and beauties, but his fellow growers will better see their faults as well, just as his neighbors will quicker note the faults and shortcomings of his children.

I was obliged to leave early in the second session and until now did not know of the committee's re-

port nor of Dr. Coit's address bearing on this subject. I am glad to note the recommendation that new varieties be submitted to a committee for various degrees of approval; but I would go even further and forbid the introduction of a new sort until it has passed certain standards of distinctiveness and merit which may be established by the society. Of course, this could bind only members of the society, but I think every grower of importance will soon desire to become a member if he is not already enrolled.

Just a word concerning the comparison which to me illustrates the importance of a decisive stand being taken by the society in this matter so that in our attempt to straighten out the tangle already in hand, confusion does not become more confused. Before the meeting convened, the similarity of Jeanne d'Arc and Golden Harvest was brought up by me in conversation with three other members (one an officer) of the society and it was agreed that these varieties were identical, or if there did exist any variation it was too slight to warrant the existence of Golden Harvest as a distinct sort. A year ago, when I was impressed with this resemblance, I wrote to the raiser of Golden Harvest asking him to point out the differentiations of that variety from the pre-existing Jeanne d'Arc. This is his reply:

"The Golden Harvest is very similar to the Jeanne d'Arc, but think the latter is a rather weaker grower. Many varieties that are cultivated now are so very near alike that it is hard to distinguish between them."

Mr. Ward, admitting that the blooms are the same, claims that the difference consists in that one (Golden Harvest) blooms two days earlier than the other and that one, (Jeanne d'Arc) is decidedly the stronger grower. It was bad enough for me to have failed to notice a difference so striking as to warrant a perpetuation of both sorts, but here is the raiser of Golden Harvest claiming that the only difference he observes is that Golden Harvest (not Jeanne d'Arc) is the stronger grower. Now Mr. Ward earnestly advocates the elimination of existing varieties to a possible one hundred, and assuming his claims for these two sorts to be facts, where, retaining both of these, is the process of elimination to begin among the several hundred worthy varieties we already have?

Fair Lawn, N. J. GEO. H. PETERSON.

Sweet Pea Sports.

Editor Florists' Exchange:

Absence from home has prevented me replying sooner to Mr. Weaver's communication in your issue of June 21, wherein that gentleman says that sweet pea Earliest of All came before my Christmas Pink or even Florence Denzer. That statement is not correct. Both of these latter varieties had been on the New York cut flower market for several years before others were known; and it is very strange to me that we never heard of "sports" previous to my sending out my seed. Now we have the Algerian and the English "sports," and also Mr. Weaver's "sport." Mr. Weaver says he has not seen any variety similar to his on my place, although he has visited me two years. That is curious. Two years ago I had a 25-foot bench of that variety and this year have 75 feet of space devoted to it. Probably at the time of his visit the vines were so closely picked that he could not see the difference. Now, friend Weaver, why did you not come out and tell me just what you were looking for, and bring one single flower of your "sport?" I would have shown you plenty of it, and if it had happened that none of the flowers were on my place at that time, I could have informed you where they could be found, as I have many of my varieties always on trial with trustworthy growers all over the country.

Mr. Weaver seems to be excited over having discovered what he calls a "sport." As soon as I returned from visiting his place I sent him several flowers of the very same variety that he has, and he acknowledged them to be the same as those of his "sport." In addition, I sent other lavender sweet peas. Did these also sport with me? Never! I have worked hard to obtain these varieties, and only succeeded by careful hybridizing. I counted this year on my place over ninety kinds, including last year's crosses. Now if all these should be "sports," why was it that they all appeared with me, or why are sports to be found somewhere else only as a single plant in a whole bed? It is an easy matter to obtain one or two seeds from some one and drop them in beds of the common kinds, and when in flower, call in experts to see them growing. This trick is too old for notice.

Mr. Weaver states that the establishment of Mr.

Sim is an experiment station for my varieties of sweet peas. That is true; but Mr. Sim is not alone in this, as many of my other customers also make trials of my novelties, and Mr. Weaver could just as well be included among these, provided he gave the plants the same treatment as his "sport." Your correspondent asks why Mr. Sim has changed his mind since August, 1906. I do not think Mr. Sim has done so, for all of us agree that there is very little chance of bees hybridizing sweet peas. By Mr. Weaver's own testimony the chance is one in 10,000, which statement is about right, on an average. Mr. Weaver also says he has never been able to see any insects upon sweet pea flowers. He should go to California when the thermometer stands at 100 degrees, Fahr., and go over the sweet pea fields. There he will see the flowers wilted on the plants, especially those varieties which burn readily, and he will discover something he has never seen before. He will find many flowers without wings or standards, some in the shape of tulips and the pistils and pollen exposed before opening.

Mr. Sim is asked if he ever saw more than one color flower on any single plant in my greenhouses. I also now put the same question to him, as well as to Mr. Weaver, and to any other florist who has visited me. I myself have never seen this, unless the flower had been burnt or artificially colored.

Mr. Weston of Kent, England, is, I observe, a firm believer in sweet pea "sports." He told us not long ago that he sowed a few sweet pea seeds from one pod, which had been hybridized, and almost every one of these seeds produced a flower of different shape and color. My own experiments confirm this, but it cannot be stated which of the varieties, raised out of the same pod, were hybrids and which were "sports." Does Mr. Weston call all of the hybrids for which he has not worked "sports?"

Mr. Weston cites as an example the Countess Spenser varieties that have "sported all over." It would now be opportune if the originator of this beautiful strain, which will represent the leading varieties of the future, would tell us what kind of pollen he used in securing the Countess. The more I become acquainted with the Spenser varieties, the more firmly I believe that they have been obtained from flowers other than those of the sweet pea family. Probably the originator (it is strange that no one over here knows his identity, only as the Countess Spenser's gardener) may have been hybridizing some other flower immediately before working on the sweet pea, and has used the same brush. It would be of immense value to hybridizers, to be told of the origin of the Countess Spenser sweet pea.

I am sending to Mr. Weston, as well as to several other growers in England and on the continent, twenty-five varieties of my sweet peas. If Mr. Weston finds something new among these, he should not consider them "sports," as probably the same things have been fixed and disseminated for years.

Bound Brook, N. J. ANT. C. ZVOLANEK.

To Destroy Rats.

Editor Florists' Exchange.

In your issue of June 29, there is a communication from John Burfeind, relative to poisoning rats, ants etc., but he does not say how much alum is to be put in the lime, or how much lime in the alum. I would like very much to know the proper proportions to use, as I would like to try this remedy. It might also be useful for cutworms.

Palm Beach, Fla. J. B. D.

As we at all times faithfully fulfill the command to "rejoice with those who do rejoice," etc., we willingly join in Horticulture's jubilation over its fifteen and twenty-five per cent. increases. We hope, however, these jubilatory augmentations will not contribute to an aggravated affliction with the "exaggerated ego," or create a greater enlargement under the hat of our esteemed fellow laborer. This is not "scoffing," but our "earnest cry and prayer."

The index to volume XXIII of The Florists' Exchange is issued as a supplement to this week's number. If you fail to receive a copy of the index, please advise us.

The subjects mentioned in the index are those which have appeared in The Florists' Exchange during the past six months, and their diversity and value, we think, justify us in saying that, when compared with what is provided by our contemporaries who charge the same subscription price as we ourselves do, the subscribers to The Florists' Exchange are receiving their money's worth, with interest added. Preserve the index for future reference.

The Congressional Free Seed Distribution.

By ALEXANDER FORBES.

(Continued from page 86S.)

It is also shown by the Agricultural press that they do not want this waste of public funds to continue. To show this, I will read the following:

NATIONAL AGRICULTURAL PRESS LEAGUE,
OFFICE OF SECRETARY.

Chicago, Ill., December 6, 1906.

At the annual session in Chicago, December 5, 1906, the National Agricultural Press League adopted by a unanimous vote the following resolutions:

"Whereas, notwithstanding the protests of the farmers of the country, irrespective of locality or political affiliations, Congress at its last session again determined to continue the doubtful policy of distributing seeds of common and well known varieties; and

"Whereas, the National Grange, the Farmers' National Congress, and hundreds of State and local agricultural and horticultural societies have adopted resolutions denouncing this practice and calling on Congress to turn the money over to the Department of Agriculture for work with the State experiment stations in the developing new varieties of seeds and plants suitable to the localities; and

"Whereas, we believe that a vast majority of the farmers of this country are opposed to the existing policy; Therefore, be it

"RESOLVED, That the National Agricultural Press League hereby reaffirms its opposition to the Congressional free seed distribution as at present conducted.

RESOLVED FURTHER, That copies of this resolution be sent to all members of this league and to the members of the Committee on Agriculture of the United States Senate and House of Representatives."

The Truckers and Market Gardeners are also opposed to the Congressional Free Seed Distribution, as will be shown by the following:

"The South Texas Fruit and Truck Growers' Association, consisting of affiliated local associations throughout South Texas and the Gulf coast country, the total membership of which is over 1,300, passed unanimously the following resolutions during their regular meeting at Edna, November 13 and 14, 1906:

"Whereas, the free garden seed received from members of Congress at the expense of the General Government are usually of varieties known to be unsuited to the soil and climate of South Texas, and hence are worth less to us, and

"Whereas, these seed are sent to us by our representatives in Congress under the mistaken idea that a favor is being conferred, which mistaken idea we hereby wish to correct; and

"Whereas, the expense to the General Government of obtaining seed and distributing them is a considerable item, and a serious economic waste wholly unjustified by the results obtained; and

"Whereas, the amount of money spent annually for seed distribution if apportioned among the United States experiment station, would be a thousand times more beneficial to each of us than as now spent, for it would enable more investigators to work on horticultural problems the solution of which would be of lasting value to every vegetable grower and to the whole State; Therefore be it

"RESOLVED, That we, the South Texas Fruit and Truck Growers' Association, thank our Representatives in Congress for their past favors in the way of free seeds, but assure them that these favors were mistaken kindnesses on their part; that we condemn the practice of free distribution of garden seeds as an economic waste wholly unjustifiable; that in the future we will not accept from the Government free garden seeds; that we urge our Representatives, as a favor which we will heartily appreciate, to vote against the bill appropriating funds for the distributing of free garden seeds, and to use their influence to have the amount thus saved appropriated to the experiment stations of the country, whose valuable work is indorsed by all right-thinking men.

Peony Festiva Maxima

Cottage Gardens Company, Growers.

"RESOLVED FURTHER, That a copy of these resolutions be sent each Congressional Representative from South Texas and to the press of the State with a request for its publication.

W. H. TRAVIS,
Palacios, President.
S. A. MCHENRY,
Santa Maria, Vice-President.
C. A. WALTON,
Victoria, Secretary-Treasurer."

The Agricultural experiment stations in every State are decidedly opposed to the distribution, and the Department of Agriculture itself is now arrayed against it. Even as far back as 1903 Secretary Wilson wrote with regard to the securing and distributing of miscellaneous garden seeds:

"With regard to the securing and distributing of miscellaneous garden and flower seed, the fact remains that this work does not accomplish the ends for which the law was originally framed. There are collected, put up, and distributed now, on Congressional orders, nearly 40,000,000 packets of miscellaneous vegetable and flower seeds each year. These seeds are the best that can be obtained in the market, but from the fact that large numbers of packets are wanted, the seed obtained can be of standard sorts only, such as are to be found everywhere for sale in the open market. As there is no practical object to be gained in distributing this kind of seed, it seems very desirable that some change be made. To this end, it would seem wise to limit our work entirely to the securing and distributing of seeds, plants, etc., of new and rare sorts," and later, by the Secretary's letter to the Hon. J. A. Tawney, dated March 15, 1906, from which the following is an extract:

"In my former letter I commented on the value of this miscellaneous distribution of garden and flower seeds, calling attention to the fact that it was difficult to state what such value might be. I also emphasized the fact that in my judgment the money thus expended could be put to better use."

If further proof were needed that the Department of Agriculture was in favor of a change in the distribution, it can be found in Dr. Galloway's testimony before the House Committee on Agriculture, dated December 17, 1906. This testimony was prefaced by the remark that Dr. Galloway would present the Department's view and represent the Secretary in this matter. His

view, therefore, may be considered the views of the Department.

"If Congress, in its judgment, believes the time has come to make a change, the Department stands ready to indicate in what manner this change can be made and in what way the funds now appropriated might be used for the upbuilding of plant industries. I am here to present this plan and to invite your suggestions and criticisms upon any points regarding it. The plan that we want to suggest has for its object:

"First. The abandonment of the miscellaneous distribution of ordinary seeds.

"Second. The securing, through all the sources at the command of the Department, of valuable new seeds, plants, bulbs, etc., which are being developed at home and which are known only locally, and the distribution and testing of these new things in regions where it is believed they may have value.

"Third. The securing from abroad of new seeds, plants, etc., for introduction into this country, and the upbuilding of agricultural industries as a result of this work."

He then went on to enumerate the number of projects which the Department had worked out, some of which were described to the Committee, seventy-five in all, including such subjects as the extension of Arabian alfalfa in the Southwest, extension of alfalfa growing into States where not now a staple crop, distribution of new varieties of cotton, the improvement of cowpeas, introduction and testing of alkali-resistant crops, sugar-beet seed growing, bulb growing in the United States, etc., etc.

It will therefore be seen that the seedsmen are not the only body who oppose the Congressional Free Seed Distribution. As has been shown, we have also the farmers, the market gardeners and truckers, the agricultural experiment stations, the agricultural press, and last, but not least, the Department of Agriculture. All these are opposed to the present manner of distribution. Who, then, is in favor of it? Congress, and Congress alone! Why does Congress want this distribution of seeds conducted on these lines? The reasons, in my opinion, are purely political. It enables the Congressmen to come in touch annually with their rural or suburban constituents. It enables Congressmen to shake hands, so to speak, with their farmer friends, and there is no doubt some of these constituents feel "tickled" that the Congressmen remember them in this way once a year; and small as it may appear, this same free seed distribution is considered by some Congressmen, especially from the rural districts, a valuable political asset. He is therefore anxious to remember as many of his constituents as he can, by sending them this petty package of common garden seeds.

If the distribution was confined to new, rare and valuable varieties, that were worth something, each Congressmen would probably have to be content with sending 1,000 packages annually, whereas, by the present plan, he can send out, under his own frank, 12,500 packages of five packets each, or 62,500 packets in all, and so hungry are some Congressmen for these seeds that they exchange their documents with fellow members from the cities, for their seed quotas. Hon. Chas. R. Davis of Minnesota, acknowledged to the Agricultural Committee of the House that he bought 15,000 to 25,000 packages over and above his quota, that he bought them for cash at reduced figures, some from the Department and some from agents around the corridors, who claimed that they had gotten the seeds from certain members who did not need them and who have them for sale. (Proof of this can be found on Page 5 of the pamphlet on the distribution of seeds, at the hearing before the Agricultural Committee of the House, December 12, 1906.) The following table, prepared by the Department of Agriculture, will also show how systematically this thing is done:

CONGRESSIONAL DISTRIBUTION OF VEGETABLE
AND FLOWER SEEDS, 1905-6.

(1) Number of Congressmen who distributed more than 20,000 packages of seed.. . . .	59
(2) Number who distributed more than their regular quotas (12,500 packages) but less than 20,000 packages.....	157
(3) Number who distributed not exceeding, approximately, their regular quotas, but more than 5,000 packages.....	246
(4) Number who distributed less than 5,000 packages but more than 1,000 packages..	13
(5) Number who distributed less than 1,000 packages	3
Total	478

There is at the Capitol a regular clearing house, so to speak, for handling members' quotas. Can it be wondered at, that it is a hard matter to root out or change this Congressional Free Seed Distribution; it is so dear to the heart of the average Congressman that it seems to him part and parcel of his very existence to keep this distribution intact as it is now? It is my belief that if this distribution was confined to new, and rare varieties, as it should be and as the original act provides, the majority of Congressmen would have no interest in it. There is no use in denying the fact that what Congress wants is not what is new, rare and valuable in connection with this free seed distribution, but the greatest quantity of the most ordinary kinds, that can be bought for the least amount of money.

What the Department of Agriculture is Doing for the Seed Trade.

By B. T. GALLOWAY.

(Continued from page 866.)

Promoting School Garden Work.

Two important projects for which the Department is responsible, and which have a direct bearing on the seed trade relate to the garden work in our public schools. The first efforts were directed to the training of young women in the normal schools of Washington, who were eventually to become teachers in the public schools. This work, through the efforts of Miss Susan B. Sipe, in both the white and colored schools of Washington, has met with pronounced success. The young women have been trained in the elementary lines of horticulture, in handling the ground, propagating plants from seeds, propagating plants from cuttings and by budding and grafting, and in greenhouse work in general. The surroundings of the homes of the pupils have been improved. Special pride in the improvement of school grounds has been taken. At first, a few packages of seed were sent to schools in the ordinary Congressional distribution. Since that time, seeds have been furnished through local dealers. During the last year, more than \$1,600 was spent by the school children of Washington

plots of ground and determine the size of each. The instruction of the classroom regarding cotton and wheat is emphasized when the pupils are furnished samples of seed from which these crops can be grown. Aside from this is the effect of this outdoor work on the bodies and minds of the children, which means, it is believed, the laying of a foundation for better citizenship throughout the country.

Literature Distributed.

The Department is constantly disseminating information through its Yearbooks, Farmers' Bulletins, and special bulletins, and by means of its lecturers in all parts of the country. During the past year, 24 Farmers' Bulletins on plant subjects were issued, and the Department now has for free distribution 175 bulletins dealing with products of the soil. The total number of copies of this series of publications distributed annually reaches six and one-half millions.

Dr. Galloway closed by saying that he had been able to touch upon only a few of the more important problems upon which the Department of Agriculture—a department which stands pre-eminently for the people—is engaged with its seven or eight thousand trained workers, and with appropriations now aggregating nearly \$14,000,000 a year.

Sterilization of Soils.

Growers of lettuce, cucumbers, tomatoes, carnations, violets, and other plants under glass and of plants in seed beds often find the plants suddenly dying while their

the benefit was attributed to the presence of the ashes. Heating the soil in any way, provided it is thoroughly done, will destroy fungi and nematodes. Dry heating and burning are not always convenient or advisable, but sterilization by the application of steam is entirely practicable. This can be done in boxes especially designed for the purpose or may be effected by leading perforated steam pipes through the beds.

The box method is fully described by G. E. Stone, of the Massachusetts Station, and W. E. Britton, of the Connecticut State Station, and consists essentially of tight zinc-lined boxes into which steam can be admitted under pressure, and the soil is held in shallow trays with galvanized-iron netting bottoms. Space is allowed between and around the trays, and an exposure of one hour to steam will destroy all nematodes and most fungi and their spores as well as any weed seed that may be in the soil. After exposure to the steam the soil can be spread in the beds and seeded as soon as convenient.

Doctor Stone and others have shown that as a rule seed germinates more quickly and plants develop better in sterilized than in unsterilized soil. The reason for this was studied by Schulze, a German investigator, who found that while during sterilization there were formed some decomposition products which are injurious to a certain extent for a time, these disappear after the lapse of a few days or are corrected by the addition of a small quantity of lime, and there was always an increase in the amount of available nitrogen present in sterilized soil due to the action of heat on the soil compounds, so that while growth in sterilized soil may be retarded for a short time, the plants ultimately become more

(See page 16 A issue of July 6, 1907.)

for seeds in penny packages, 160,000 packets being planted, and in addition \$800 was expended for bulbs. As an enlargement of this work, a considerable number of special packages for school gardens have been distributed by the Department to schools throughout the country. At first, 5,000 packets were sent out, but last year the aggregate was 30,000 packages of vegetable seed and 48,000 packages of flower seed, each package containing five packets. This seed is largely sent direct to teachers in the public schools, and each teacher requesting seed in supplied with a copy of the bulletin on school gardens, which sets forth the methods of handling various crops and gives suggestions regarding the laying out of school gardens.

The second feature of this work consists in substituting sets of seeds illustrative of work in commercial geography for ordinary garden sets. Teachers are greatly interested in gardens which will enable them to illustrate their instruction with reference to useful plants, such as cereals and fiber plants. Small packages are distributed through the school-garden teachers. The coordination of this work with class-room instruction has been attempted, studies in arithmetic being put into practice when children are required to measure their

foliage seems to be fresh and vigorous. This is especially true of plants in their seedling stage, and a careful examination will show that they are affected at or below the surface of the soil. The causes of the trouble are certain soil fungi and minute worms, called eel worms or nematodes. Where it is possible to renew the soil in the beds every season comparatively little loss will be met with, provided the soil is not infested when put in the beds. When the same soil is used season after season it is likely to become so filled with fungi and nematodes that the production of healthy, stocky plants will be impossible. The fungi, which are usually sterile, are present as minute threads or mycelia, and the nematodes as active worms or as eggs and encysted or dormant forms. The fungi enter the plant through the roots and cause various forms of drop, wilt, and rot, while the nematodes cause galls on the roots and thus interfere with their function as absorbers and conveyors of water and mineral matter to the plant.

Drying and freezing have comparatively little effect upon these parasites and spraying the foliage with fungicides will be of no value since it does not reach the seat of the trouble. Fortunately it is possible to almost wholly prevent the injury due to these parasites by the sterilization of the soil, either by heat or by chemical treatment. The old practice of burning brush and other material over the site of the tobacco seed beds unconsciously secured sterilization, although by many

vigorous and the total growth is decidedly greater in sterilized soils.

Where benches are prepared with tile for sub-irrigation cost of sterilization has been estimated at about \$8 per 1,000 cubic feet of soil. By better apparatus the cost could be reduced to about \$2 per 1,000 cubic feet.

Where steam is not available, it has been found that certain chemicals injected into the soil will aid in sterilizing it. A. D. Selby, of the Ohio Station, has found that formalin or formaldehyde applied to the soil in a strength of 2 pints of formalin to 50 gallons of water is quite efficient for the destruction of fungi and active nematodes, although it does not destroy the nematode eggs or encysted forms. For these steaming is best. To treat soil with formalin it should be prepared as for seeding, and after being well raked and in a friable condition it is drenched with the solution as given above at the rate of about 1 gallon per square foot of surface. A bed 50 feet long by 6 feet wide would require about 300 gallons of the mixture containing from 12 to 15 pints of formalin. This would cost from \$1.80 to \$2.25 in carboy lots. If applied to seed beds in the Fall before freezing weather sets in this treatment will keep down all forms of rot, damping off, and similar plant diseases. —Experiment Station Work.

The Massachusetts Agricultural Station at Amherst, Mass., has been making a number of mechanical analyses of soils, most of which were rose soils.

Sweet Peas.

(Read before the Pennsylvania Horticultural Society by E. D. Darlington of W. Atlee Burpee & Company, July 9, 1907.)

It is a great pleasure to the lovers of the beautiful and fragrant sweet pea to again have a favorable season for this flower after the extremely unfavorable conditions prevailing in this section for the past two seasons, as the sweet pea has decided limitations as a popular flower, and in the latitude of Philadelphia, to have it at its best, in most seasons requires some extra care in preparation of the soil and an extremely early planting. In the cooler northern sections it makes a much stronger growth and has a longer season of flowering than anything we can hope to attain. Even locally the season of blooming is quite varied and while the date of your sweet pea meeting is no doubt the best for Philadelphia and vicinity our season at Fordhook, only twenty-five miles north of Philadelphia, is fully a week later and we will not be able to contribute blossoms of some of the recent fine introductions as we would have liked to show on this occasion. Our trials at this date are looking extremely well and the vines are showing buds in great profusion, so I will take this opportunity to extend an invitation to any one interested in this flower to visit our extensive sweet pea trials at Doylestown during the next two weeks and think that I can promise visitors a fine showing in this

began to multiply. First it was the small green fly or aphid which appeared in great numbers, destroying the young shoots and buds, but these almost entirely disappeared about the time we had learned how to safeguard the vines by spraying with suitable insecticides. Then came a series of seasons when the vines suffered from the sweet pea blight, or if they escaped this trouble we had frequent heavy rains at the time when they should have come into flower, which caused the buds to blast and drop from the healthy vines without opening flowers, therefore in this Summer of 1907, it is a great satisfaction to again have weather conditions which are unusually favorable for the growth and development of the sweet pea, although nearly three to four weeks later as regarding the period of flowering than usual.

Some New Types.

As you are all no doubt familiar with the growth and flowering of the sweet pea under ordinary conditions, I will claim your attention especially to two new and very distinct types of recent introduction which in my estimation are of great promise to sweet pea growers. The first of these is the new early flowering class at present represented by only three varieties. These grow only from fifteen to eighteen inches in height when in full flower and, as a rule, come into flower in from sixty to seventy days after the seed is sown, and with the two leading varieties

ers and foliage. So far the finest varieties of this type are Burpee's Earliest of All, with the bright pink standards and creamy white wings of the popular Blanche Ferry or old-time Painted Lady type.

Burpee's Earliest White is similar to the preceding variety excepting that the flowers are a pure paper white resembling those of the Emily Henderson, but having the dwarf habit of growth and extremely early period of flowering of the Burpee's Earliest of All. Another variety of this class is Burpee's Earliest Sunbeams having faint primrose or cream tinted flowers of the shade of Mrs. Eckford, but unfortunately this variety is white seeded and for this reason does not germinate satisfactorily if planted very early in the Spring. Other distinct colorings of this desirable early flowering class are on the way and when introduced will add greatly to the popularity of the early flowering type.

I consider this class of sweet peas to be a decided acquisition to gardeners in warm southern locations and to those who wish to grow the sweet pea under ordinary conditions as well as giving a longer season of flowering where the later and larger flowered varieties are also grown; but it should be kept in mind that the season of bloom for this early flowering class is quite brief—only about three weeks in extent. If the flowers are not cut off for decorations, the small vines are soon loaded with seed pods and they cease blooming and die off.

The Countess Spenser Types.

The second type to which I wish to invite your attention is the Countess Spenser, or so-called orchid-flowered sweet pea. In this class the vines are of strong growth with heavy haulm and quite large foliage. The period of bloom is quite late, but the flowers are of enormous size, widely spread and in both wings and standards have a wavy or fluted effect which adds greatly to the beauty of the flowers. To get these very large flowers with the fluted effect requires extra preparation of the soil and a cool season so that the vines will make a strong vigorous growth and the flowers develop slowly, as in a hot Summer and with ordinary conditions of growth the flowers are distinctly smaller in size and the fluted or wavy effect does not develop. In cooler northern sections the sweet peas of this class can be grown under ordinary conditions with most satisfactory results, but with us it is best to practice the trench method of preparing the soil when planting the seed. In this method the top soil is dug out as deeply as the soil extends and a width of from one to two feet, and placed to one side, a heavy dressing of well rotted manure or fine bone-dust is then placed in the bottom of the trench and thoroughly mixed with the sub-soil by digging it in to the depth of the blade of the spade or shovel. The top soil is then returned to the trench in alternate layers with well rotted manure or well mixed with fine bone dust, a drill about two inches deep being made in which to plant the seed after the trench has been filled. This trenching, or deep preparation of the sub-soil, enables the vines to root deeply and they will continue to grow and produce fine large flowers even during the hot Summer months if this extra preparation is provided before planting the seed. In wet locations it will be desirable to take out all the soil to a depth of two feet and put tile or six inches of drainage (small stones or coarse cinders) in the bottom of the trench, and then fill in with alternate layers of soil and manure which should be mixed with the spade or digging fork as you fill in the trench.

The sweet pea likes an ample supply of moisture at the roots, but will not do well in low, wet ground or in a trench where the water is liable to stand about the roots after a heavy rain. Such low, wet ground, resulting in a heavy sodden condition of the soil, is the cause of the sweet pea blight, where the vines turn yellow at the roots and die off before coming into flower. The remedy or preventive is to plant in well-drained soil or to draw loose earth up into a slight ridge about the vines to ensure surface drainage during a period of heavy rains.

In the matter of supports it is essential that the brush or trellis, made of stakes, strings or wires, should be put in place as soon as the seed is planted or as soon as the young plants are well above the ground, as if the vines are allowed to grow several inches high and to fall over the ground before the brush or trellis is placed in position, they will not attach themselves as readily to the support nor will they make as fine or tall a growth. With the tall growing varieties the plants should not stand too closely together in the row, and if they come up thickly from a liberal seeding they should be thinned out to stand six to eight inches apart, if the best growth and finest flowers are desired.

This illustration shows the houses of H. A. Hall, Joplin, Mo., after the hall storm of June 14, 1907. The loss was 6,746 out of a little over 20,000 square feet upon which Mr. Hall carried an extra one-half insurance in the Florists' Hail Association

flower, should the weather conditions continue as favorable as they have been so far this season.

The splendid Eckford novelties of last year, representing the culmination of Henry Eckford's life work, and the grand new varieties of the Countess Spenser or fluted type are growing finely and bid fair to amply make up for our failure to get flowers last year when the buds were blighted and destroyed by heavy storms.

Early Troubles.

Twelve or fifteen years ago when the sweet pea first began to attract popular attention among flower gardeners, with the first introduction of Mr. Eckford's fine new varieties, the prevailing weather conditions were quite favorable for a number of years, and to secure a fine show of flowers it was only necessary to plant a liberal quantity of seed early in the Spring and to give about the same cultivation as is required for early garden peas; but after several successful seasons and about the time that the improvements in types and colorings became most marked, the troubles of the sweet pea grower

have the hardy black seeds which admit of a very early planting. These dwarf early flowering sweet peas are of the easiest cultivation as the seed is sown in drills in well prepared ground early in the Spring or at any time during the Spring or early Summer months. The seed is covered about two inches deep with fine soil, using one ounce to ten or fifteen feet of row, the plants forming a closely matted row of compact growth or low hedge-like form suitable for edges, etc. The vines or plants are quite stiffly erect, and bear three to five sprays of flowers to a stalk. The flowers are considerably smaller in size and shorter stemmed than those of the taller growing varieties, but if the entire stalk is cut off just above the soil they make very attractive bouquets, as each stem shows three or more sprays of flowers and buds finely relieved by the small dark green leaves, and when used in this way, loosely bunched, they really furnish a more attractive vase or bouquet than the longer stemmed, larger flowers which lie more closely together and the large vines and foliage of which do not lend themselves so readily in making a graceful combination of flow-

The Countess Spenser, the original variety of the orchid-flowered type, is a beautiful large flower fully two inches across the standards in a well grown flower, with three to four flowers on a stiff stem fifteen to eighteen inches in length; both standards and wings are beautifully edged and suffused with soft rose pink on a silvery white ground. Gladys Unwin is a lighter shade of pink more evenly suffused and has the edges of the petals slightly serrated in addition to the wavy or crinkled texture. John Ingman has the same very large wavy or crinkled flowers in a deep rich shade of rose, and in Helen Lewis the standards are a bright orange or salmon scarlet, with dark rose colored wings. Ever since the Countess Spenser was received from England it has "sported" quite freely and a number of selections have been made and established so that we shall soon have quite a variety of colorings in this most attractive type of sweet peas; among others a very large-flowered, pure white, with the finest wavy or crinkled effect, is promised for early introduction.

Eckford's Recent Varieties.

In the most recent Eckford varieties Henry Eckford is the finest orange scarlet yet obtained, but the flowers burn badly under the hot sunshine, and even in England it has to be shaded with a cheesecloth protection to retain the brilliant coloring. Queen Alexandra is a brilliant scarlet, a richer shaded and more open flower than King Edward VII. Sybil Eckford is a very distinct apricot tint, but in this as in Scarlet Gem and Coccinea, the flowers are not as large, the charm lying in the very bright and distinct shades of coloring.

The Use of Manure as a Summer Mulch in Vegetable Forcing Houses.

BY W. J. GREEN AND C. W. WAID.

It is a common practice among those engaged in forcing vegetables under glass, in case the soil in the beds is not renewed, to allow it to become very dry during that portion of the season when the houses are not in use. No water is applied and as the temperature often rises above 100 degrees Fahr. the soil loses nearly all of its moisture during the two or three months when no crops are grown.

One reason for following this method is that it is convenient, as it requires no expenditure of labor. Some believe that the drying out of the soil in this manner has a beneficial effect in preventing diseases which affect the lettuce crop.

Professor Geo. E. Stone, Botanist of the Massachusetts Agricultural College and Experiment Station, has made and reported some experiments which throw light upon the question of the effect, upon subsequent crops, of desiccation or drying of greenhouse soils.

In his report for 1902, Professor Stone has the following to say as to "The Effect of Desiccation on Soils": "The practice of desiccation or drying greenhouse soil by aid of the heat of the Summer sun has been in vogue with us for some time, for the purpose of observing what effect such treatment would have on certain organisms. We have already shown that the clerotinia or the drop fungus when dried is greatly accelerated in its activity, which increases to a great extent the amount of infection in the succeeding crop of lettuce." (Professor Stone refers here to a test reported in September, 1900, Bul. 69, Hatch Experiment Station. "In this test the house was closed during the greater part of August, September and October, at which time the soil was subjected to the intense rays of the sun which heated the soil up to a temperature of 123 degrees Fahr. and the air thermometer registered 140 degrees Fahr. As the top layer of the soil became dry a lower layer to the depth of a foot was forked over two or three times, so that practically the whole amount of soil became desiccated. The result of drying out of the soil in one bed containing 368 plants was that 235 or 76 per cent. were subject to Drop, and 66 or 21 per cent. to Rhizoctonia. The number of plants which succumbed to the two diseases was 301 out of a total of 368, or 97 per cent. The other half of the house, containing 264 plants, was treated similarly, with about the same result.)

"There are other effects of drying on the soil which prove very destructive to the development of lettuce plants, although we have not observed this effect on other species. On lettuce we have observed this repeatedly, and the characteristic results of such drying are manifested in a stunted growth and abnormally colored and worthless crop. The crop scarcely ever attains more than one-third of its size. The texture of the plant is poor, being thick and tough, and inclined

to crinkle. That this is caused by desiccation alone is shown by the fact that wherever any drip from the roof fell upon the soil during the Summer rains, the plants growing in such places were always normal. Distinctly sharp lines can be observed in a lettuce crop grown under such conditions, owing to the difference in development brought out by desiccation and the presence of a small amount of water due to dripping. Instances have come to our notice where large houses devoted to lettuce have been allowed to become quite dry, with the same result on the crop as noted above. The remedy for this trouble is obvious: namely, not to allow the house to become too dry in Summer, but to keep the soil more or less supplied with water. If such drying occurs, the soil can be entirely renovated by applying hot water or steam to it."

Three years ago the Ohio Station began an experiment to see what effect the use of strawy manure would have on the soil when used as a mulch during that part of the Summer when crops are not growing in the greenhouses. This manure was applied as soon as the tomato and cucumber vines were removed from the houses, or about the first of August. It was put on to a depth of from five to six inches and spread evenly over the entire surface of the beds. As soon as it was on, water was applied in the form of a spray until the manure and soil were thoroughly wet.

The object of this wetting was first to leach the fertility of the manure into the soil and second to wet the soil sufficiently so that with the strawy mulch it would remain moist for several days. The operation of watering was repeated as often as needed; two or three times a week in bright weather.

When it came time to plant the lettuce, about the middle of September, the coarse part of the manure was removed from the beds and carried outside. The finer portion of the manure was worked into the soil at the time of spading.

It was noticeable that the soil which had been treated with the mulch was in excellent mechanical condition when it was worked up for the first crop. There were no lumps, as there often are in soil which has been allowed to bake in the sun for weeks at a time. It was also darker in color than unmulched soil. The lettuce plants which were planted in this soil started off nicely and grew rapidly and satisfactorily in every respect. No further application of manure or fertilizer of any kind was made for the second and third crops of lettuce. The growth of these crops was very satisfactory, as was that of the first crop. Liquid manure was applied to the tomato plants when the fruit began to ripen. This fertility might have been applied in the form of manure as a mulch and probably it is best to apply it in that way rather than in the liquid form.

This method of treating the soil during the Summer gave such favorable results the first season it was tried that the Station induced several practical greenhouse men to try it last season (1906). The junior author of this circular has kept in touch with many of the larger vegetable forcing establishments throughout the State during the past year or more by making frequent visits to their greenhouses.

One firm, the Miller Brothers, of Toledo, Ohio, began the use of the Summer mulch the same season the Station began it, neither party knowing that the other was trying this method of soil treatment. They have continued this practice and are well pleased with the results.

Some of the parties who promised to make a test of the use of manure as a Summer mulch were unable to do so for various reasons. Of those who tried it some did not apply water frequently enough, thus allowing the soil to become dry and destroying the value of the test. Others grew tomatoes as a Fall crop on the mulched area and lettuce on the unmulched area, thus preventing a fair comparison. Still others mulched all of their soil, not leaving any without mulch for comparison. In one case where a careful mulch test was made other conditions entered in in such a way that safe conclusions could not be drawn.

Taking the results of the Station tests for the two seasons, together with the results secured by the Miller Brothers for the same length of time and gleaned what information it has been possible to obtain from various sources, the Station does not hesitate to recommend this treatment for soils which are to be used for vegetable forcing. It must be borne in mind, however, that no half-way or slipshod methods of using the mulch will give satisfactory results. There should be sufficient fertility in the manure to furnish enough plant food, when leached into the soil, to supply the three crops of lettuce. The quantity of manure must be sufficient, also. At least five or six inches should be applied. A considerable quantity of coarse material in the manure, such as straw, corn stover, etc., is an advantage. Fresh manure has been used at the Station each time, and, while we have had no chance to see the effect of the use of the well rotted manure, we are satisfied with fresh manure, as we know that it will give good results.

Where it is the practice to mulch the cucumber or tomato crop the manure used for that purpose can be left on and more added, provided the cucumbers or tomatoes have been free from disease. In case these crops

have been diseased, it would be advisable to remove the mulch used on them and apply new.

Frequent sprinkling of the manure on the beds is very essential, and where the Skinner or some other mechanical system is in use this can be done thoroughly and with the expenditure of little time and labor. Where it is necessary to water by hand it will be harder to get the work done, but it must not be neglected, as failure is sure to follow the lack of application of sufficient water to properly leach the fertility of the manure in the soil, and to keep it moist.

When it comes time to put in the first crop, if the soil is in need of humus the entire mulch may be spaded into the soil, but most greenhouse soils do not need the addition of so much coarse material. Where the soil is fairly well supplied with humus the coarser part should be taken off and removed from the houses and the finer portion worked into the soil.

We are not prepared to say what effect the use of the Summer mulch may have on the diseases affecting lettuce, except that the Station greenhouses have been very free from all diseases of lettuce since we have been using this method of treating the soil. The Miller Brothers' lettuce crops have also been practically exempt from these diseases during the two years they have been mulching. In no case where the mulch has been used have we observed an increase in the number of diseased plants over an equal area not mulched. These facts, taken together with results secured by Professor Stone and reported in this circular, would lead us to expect beneficial rather than detrimental results from the proper use of Summer mulch, in so far as it affects the diseases of lettuce. The theory which Professor Stone advances is that when the soil is allowed to dry out the organisms in the soil take on a resting stage and then when the soil is made wet at the time of putting out the first lettuce crop they become very active. If, on the other hand, the soil is kept moist, the organisms do not go into a resting stage and are about as active at one time as another. In the latter case they are not nearly so active when the crop is growing as in the former.

It will be seen from this that if the Summer mulch has any beneficial effect in controlling or preventing lettuce diseases it is entirely a preventive measure and not a cure.

This method or any other one, however, will not overcome or prevent damage which results from bad methods of handling the crop. For example, poor ventilation is responsible for a good deal of the loss from lettuce drop. No matter what care may be taken in the preparation of the soil, if the ventilation is faulty, bad results are sure to follow. Then, too, some growers persist in the use of lank, overgrown plants. This practice is responsible for more or less loss each year. In some cases not enough water is applied and in others it is applied too freely and at the wrong time. Other faulty practices might be mentioned, but these are sufficient to show that no matter how much care may be exercised along some lines it, through carelessness or lack of knowledge, other important things are neglected, the result will be anything but satisfactory.—Circular 69, Ohio Experiment Station.

NEW JERSEY FLORICULTURAL SOCIETY.—At the last meeting, in the absence of an essay only a short business session was held and the subject of the Fall show discussed. Henry Hornacker of East Orange made an appeal for representation and reward for the tradesman in the schedule. The sentiment of the meeting seemed to coincide with this, and it was ordered that \$9 and \$6 for the best 25 cut chrysanthemums be made open to the commercial men.

Lager & Hurrell, Summit, N. J., staging an attractive collection of cut orchids, consisting of Cattleyas Sanderiana, Gaskelliana, white Mossiae, Mossie Wagneri Dendrobium nobile Ameisana and Vanda teres Andersoniana. The white forms of Mossiae and dendrobium were much admired. The firm is now cutting an average of one thousand flowers per week.

Joseph A. Manda, West Orange, exhibited an Odontoglossum citrosimum with twenty-three flowers upon a graceful, pendant spray; Orson A. Miller, East Orange, a specimen Cattleya gigas. Delphiniums were staged by the Colgate estate (grower, William Reid); delphiniums and carnations Victory, Mrs. Lawson and Bride by Mr. Charles Hathaway (grower, Max Schneider); Cypripediums Lawrenceanum, barbatum, superbum, and an Odontoglossum citrosimum, with two sprays, by Mr. Stuart Dickson, grown by Andrew Larsen, who also contributed some garden peas of the Gradus variety; delphiniums and iris, by Mr. Stewart Hartshorn (grower, Arthur T. Caparn). In addition Mr. Caparn exhibited Romneya Coulteri, a white flower with striking yellow petals an inch across, the whole bloom measuring eight inches. Specimen gloxinias came from Mr. John Crosby Brown (grower, Peter Duff); these were of phenomenal size and were awarded 95 points by the judges. J. B. D.

DIRECTORY OF RELIABLE RETAIL HOUSES

FOR THE RETAILER

For reproduction on this page, we solicit from our readers engaged in the Retail Trade, good, clear photographs of subjects that are of general interest, such as store interiors, designs of different classes, new delivery wagons, etc.

This retail florist firms advertising under this heading will accept and fill orders for flowers and floral designs forwarded them by mail, telegraph or telephone, the usual commission of 25 per cent. being allowed.

\$25.00, payable quarterly in advance, will entitle the advertiser to a four-line card, under this heading, for one year, 52 insertions. For every line additional to four, \$5.00 will be charged. Four lines will average 32 words; each additional line, 9 words. Each advertiser receives one copy, free, of our Florists' Telegraph Code.

Retailers desiring a share of out of town trade should be represented by a card in this column.

Funeral Work.

Roses and carnations are getting poorer in quality and decidedly smaller in quantity, but there is plenty to choose from, and lots of good material for making up. American Beauty and Kaiserin Augusta Victoria roses are of very good quality, and Killarney is holding its own, while the unprecedented lateness of the season is giving us lots of garden flowers that would otherwise have been over long ago. Gardenias are very plentiful and so are orchids.

There is a quantity of funeral work being done at the leading florists' stores illustrating what can be accomplished with a Summer supply of flowers.

A large standing anchor seen recently was very handsome. It was about seven feet in height. The frame was filled round, all sides being alike; this was entirely filled with white pyrethrum stemmed all one length, and inserted close so that each flower touched the other. An entwining rope of lavender

Flowering Twigs of Robinia hispida, Rose Acacia

centaureas, starting at the ring at the top and continuing on down to the base, made a beautiful contrast. The base was filled with white centaurea.

The casket cover for this funeral was made entirely of sweet peas, the design being a loose pall. The top was done with white sweet peas, continuing over the sides to a depth of about four or five inches; the remainder was finished with lavender sweet peas, which encircled the casket to a depth of about twelve inches. The loose folds at the corners were finished with sweet peas of a light purple hue, blending beautifully with the lavender shades. A cross of dark purple sweet peas rested on the top of the casket.

A large standing wreath, (crescent form) was also very fine. Highly colored croton leaves formed the body of the wreath, the larger varieties being employed at the widest part of the crescent, gradually tapering to the points with the fine-leaved varieties. A large cluster of gardenias and a bow of wide lavender ribbon mingled with the croton leaves at the wide portion of the wreath. The base was filled with highly polished variegated aspidistra foliage and long spikes of white gladiolus.

Sweet william, Dianthus barbatus, made a surprisingly handsome standing cross, the major portion of the piece being filled with the white variety, with a large cluster of deep crimson at where the

arms cross, the base filled with the same color. Asparagus plumosus was employed for filling in. The sweet william has good lasting qualities and, although not generally associated with funeral work, makes up most effectively, especially in larger pieces.

A Dinner Decoration.

A dinner decoration of iris, seen at a prominent hotel in this city, will illustrate the value of this beautiful flower for decorative purposes. The variety used was Iris Kämpferi. The guests were seated on the outside of a large hollow circle, the inner diameter being about 16 feet. About 8 feet of the center of this circle was devoted to a large tank containing water, with a fountain in the center. About two hundred flowers of Nymphaea odorata floated on the surface. From the edge of the tank up to the inner edge of the table, a bank was constructed of chicken wire; this was covered with thick green, lump moss. Glass vials were inserted in clumps and irregular clusters; these were filled with the iris in all its varying shades—from purest white to the richest purples, the natural foliage being the only embellishment.

D. RAYBUN.

Single Dahlias.

One of these days the American public will begin to enjoy the grace and beauty of the single dahlia, which, as a rule, is still quite neglected. For cut flowers no class of dahlias can compare with the singles, as anyone will agree who ever saw an artistically arranged bouquet of them. The advent of the Twentieth Century class with its large flowers of several beautiful shades, has done a great deal to make single dahlias popular, but any loosely arranged row of "petals" about a central disk is not a single dahlia in the exact sense of the word, at least, not in the English acceptance of it. Over there the rules governing "singles" are just as rigid as the rules governing the other classes. A single dahlia means a compact row of eight overlapping petals, usually reflexed at the tips and either self-colored or of two or more colors beautifully blended, often with a well-marked central ring and frequently tipped. Such flowers are not only beautiful to look at but last exceedingly well when cut, far better than do the loose stellate forms one usually sees. It is easy to get single dahlias from seed, and such flowers are often interesting and in a sense beautiful, but do not compare with such choicely bred singles as "Snowdrop," "Serita," "Columbine," "Mikado," "Victoria," "Stromboli," "Beauty's Eye," and others that might be named. Why does not someone see that such choice things are properly set forth?

Quite apart from this class and also from the "Twentieth Century" class is a new race of so-called single cactus dahlia that a well-known house in Scotland is exploiting with much success. These are airy and graceful, too, in a way all their own, and also deserve to be better known.—N. A. L. in Dahlia News.

Robinia hispida, Rose Acacia.

For several years a variety of the Rose acacia, Robinia hispida, has been common in the gardens of Philadelphians. This variety is of rather low growth and spreading habit, and although its flowers are beautiful it never produces any seeds. This is probably the one mentioned in some botanies as "a dwarf variety, in the pine barrens of the lower district of North Carolina." The one from which the flowers illustrated herewith was taken is an upright grower, attaining a height of from 8 to 10 feet, and besides flowering freely, it bears clusters of pods of seeds, which are in themselves an object of beauty, because of the reddish hairs with which they are clothed. These hairs are to be found on all parts of the bush, the branches, leaf stalks, flower stems and pods, all being clothed with them. In the accompanying picture of the twigs with flowers, the young pods just forming are to be seen. When these pods are fully formed and still in their young state, they ornament the bush very much. This, the seed bearing one, is as yet scarce in cultivation. When it becomes better known it will be preferred to the older known one, being much its superior in every way.

JOSEPH MEEHAN.

The week end half holiday during the hot Summer months is a very popular institution across the Atlantic. There is a general belief that it would prove equally acceptable and beneficial here. Greenhouse employees, especially, would welcome it, and the rest would make itself felt by increased vigor throughout the week.

BOHN SYPHON REFRIGERATOR

..FOR FLORISTS..

St. Paul, Minn., May 10, '07.

WHITE ENAMEL REFRIGERATOR Co., St. Paul.

Gentlemen:—We have now used the new show case which you installed for us about six months ago. We can say that it is everything you promised for it, and that is "perfection."

We don't know what else we could say except the first case which you built for us about seven years ago helped materially to our success. Your system is certainly ideal for keeping flowers.

The workmanship on this new case could not be better. We have had people say, "Why that is more finely finished than our piano."

Yours truly,

HOLM & OLSON.

STYLE "L" BUILT FOR HOLM & OLSON. ST. PAUL, MINN.

A Live Florist Cannot Afford to be Without a Bohn Patent Syphon Refrigerator.

Everyone who is familiar with it says "It is the ideal Florist's Refrigerator."

WHITE ENAMEL REFRIGERATOR CO., St. Paul, Minn.

New York. The Week's News.

The weather is quite warm at present, but it is seasonable and Summer-like, and is enjoyed by every one. It is reported around the city that collections are very hard. It seems strange in these prosperous times, and when a great many of the trade are visiting either mountain, seaside resort, or Europe, that such a condition could be possible, and it suggests to one the thought that if our business was organized and conducted upon the plan that it ought to be, and a regular time allowed for all accounts, this story about collections being so stiff, that turns up every Summer as sure as Summer comes, could easily be avoided.

The firm of Perkins & Schumann, wholesale florists at 57 West Twenty-sixth street, has been dissolved, Mr. Schumann retiring. Mr. Perkins will continue the business, and has taken in as partner his old employee, Hugh Nelson, who has been with him for over thirty years.

A meeting of the directors of the New York Market Florists' Association was held in their offices on lower Broadway on Tuesday morning. The meeting for election of directors takes place Monday, July 22.

Harry A. Bunyard, salesman for A. T. Boddington, seedsman, 342 West Fourteenth street, went to Boston

last Saturday and brought home August Loeber, who for three months has been ill in a hospital there. Mr. Loeber, it is expected, will be able to resume his duties as traveler for the Boddington house within the next ten days or two weeks.

P. A. Keene, formerly of the firm of Keene & Foulk, Flushing, N. Y., and connected with the Morris Nurseries for the past year, has formed a corporation with George Achelis, owner of the Morris Nurseries, West Chester, Pa. The new company is to be called the Morris Nursery Company. They have 200 acres planted in nursery stock, and are capitalized at \$50,000, which is fully paid in. The main office of the firm is at West Chester, Pa., the New York City branch office being at 1 Madison avenue, and under the management of Mr. Keene, the home office being under the supervision of Mr. Achelis.

Mrs. Margaret Nicol of 14 Oak street, Jersey City, N. J., and her son, John Nicol, Jr., have both waived the right to administer the estate of the late John Nicol who died on May 19 last, and as a result the New Jersey Title Guarantee and Trust Company has been appointed executor to wind up the affairs of the deceased for the benefit of the widow and her son. The exact value of the estate is not known as no inventory has as yet been filed. Mr. Nicol left a will

which has been admitted to probate, in which he left all to his widow whom he named as the executrix.

The firm of Ordenez, de Nave & Company, orchid specialists, Madison, N. J., has been dissolved, and is succeeded by Ordenez Brothers, who will continue the business at the same address, and assume all the liabilities of the old firm.

Newport, R. I.

Trade Notes.

Among the flowering plants very noticeable in several of the best florists stores now are campanulas in full flower. These plants make a great show and are so richly furnished with bloom that they are picked up quickly. Campanulas are of such easy culture that there is no difficulty in having an unlimited number in pots ready for call now. Nice plants of rex begonias of choice varieties are also offered and find ready purchasers. Foliage and flowering plants of medium size and in medium size pots are favorite purchases of society ladies. Although plants are not perhaps used as much for table decoration now as they have been, still there seems to be of late a disposition to use them in considerable numbers again. Crotons of good color and dracaenas are always favorites; so also are medium size plants of Pandanus Veitchii and the various types of nephrolepis, except the old Boston fern which is used largely for other purposes. Fancy caladiums are delightful plants for house work,

and the florist who is fortunate enough to secure a large number when engaged in the work of decorating for an entertainment invariably accomplishes something which calls for many complimentary remarks resulting often in future commands. For a plant decoration for a moderate size dinner party there is however, nothing that approaches Adiantum Farleyense; this fern lends itself admirably and with unmistakable grace to this kind of work. Either large or small or both sizes of plants may conveniently be used. There are large numbers of Adiantum Farleyense grown and used in Newport private gardens, but there is not one commercial man engaged exclusively or otherwise in their cultivation, hence the trouble often experienced by florists in procuring a supply. These plants bear shipment all right, if carefully packed; but they must be carefully packed.

D. M.

Skaneateles, N. Y.

J. G. White has just completed a house for carnations. His greenhouses are located on the principal street of the village. Skaneateles is a beautiful place in Indian legendary lore it is the Home of the Beautiful Squaw. The Summer homes of many wealthy New Yorkers are to be found at different intervals along the lake front, with closely trimmed lawns and the choicest of conifers stretching down to the water's edge. Notes on Shrubs.

The majority of the early Summer flowering shrubs are now gone, so far as their blossoming qualities are concerned, but there are many of them that will soon be a wealth of berries of more or less brilliant colors.

There are many shrubs, though, that bloom late, and some of them are now in their glory. The Japanese lilacs, which are small trees rather than shrubs, are some of the most attractive. *Syringa japonica* is a shapely growing, small tree with large panicles of white flowers; the variety *pekinensis* is equally attractive, but it is more spreading in shape of plant.

A very fine shrub just coming into blossom is the dwarf horse chestnut *Aesculus parviflora*. This if planted in a large clump for effect makes a grand showing. Some of the hydrangeas are becoming showy. One of the most attractive at present is *arborescens*; then there is the sterile form of this plant which though old is beginning to attract attention, and although I have not seen it used as a border plant I am confident that it will be welcome there. *Hydrangea radiata* and its variety *nivea* are both good when properly placed, bordering larger growing shrubs. *Hydrangea quercifolia* is not often met with here on account of its not being very hardy; it makes a fine shrub, however, if in a sheltered location. The early flowering form of *Hydrangea paniculata* is just showing flowers and helps to prolong the season of this interesting class of plants.

The ninebark, *Opulaster opulifolius*, is a native shrub which should be more used than it is. A short time ago it was covered with splendid clusters of blooms all along its graceful drooping stems, and at the present time the seed pods, which are in bright red clusters, form one of the attractions of the season. The golden foliaged form of this plant is much used, but it is not nearly such a serviceable shrub as the green form. And, by the way, as this plant is known as *spirea*, it reminds me of the fact that now many of the *spiraes* are in good form and will continue so for a good deal of the season. Of these we have the *Billardi*, *tomentosa* and *Bumalda* types, and if the cutting away of the dead flowers is attended to the plants will continue to bloom until frost.

Rhus cotinus is in full flower at present and it will continue an attraction for some time. There are some forms of this plant which are much more attractive than others on account of their deeper purple flowers.

The weigolias are all about through blooming except that fine dark colored variety, *Eva Rathke*, which continues to blossom more or less through the season.

Of the viburnums the only variety now in bloom is *venosum*; this formerly was known as *mollis*, but whichever name may be correct it is a splendid shrub, not only on account of its fine flowers but for its clusters of blue berries which come later.

Cornus servicea is just in bloom, and so is that very pretty native variety, *candidissima*, which though common on the roadsides is too seldom found in cultivation.

The philadelphuses are now at their best and what fine shrubs some of them are! It is needless to mention some of the older types like *Gordonianus*, *grandiflorus* or *Falconeri*, which latter is quite an attraction on account of its small flowers. But it is to the Lemoine hybrids that I wish to call particular attention. The variety *Avalanche*, for instance, is just properly named for it is a perfect avalanche of white blossoms. Then what could be better than such varieties as *Bouquet Blanc*, *Mont Blanc*, *Lavillon Blanc* and *candelabra*, each of which is quite distinct and bears splendid forms of flowers? *Boule d'Argent* is a fine semi-double variety, and so is *Manteau de Nérmine*. There is no collection of shrubs that should be without these fine plants.

The *doutzias*, too, are attractive and some of the hybrid forms of these that have been sent out by Lemoine are in keeping with the philadelphuses.

Many of the roses are now an attraction in the borders. There are the multiflora hybrids which are very fine; then there is *arvensis* with its white flowers, *lucida alba*, also a fine white wild rose, but the best of the lot is *moschata alba*. Besides these there are the many hybrid *Wichuraiana* forms, all of which might be used successfully to brighten up the shrubbery border during July.

I was much interested in Mr. Meehan's notes on *Paeonia moutan* in last week's issue. The plants of this peony are now forming seed pods, and if one wants good plants, save the seeds, sow them as soon as ripe and you will be satisfied with the results. The finest lot of these plants I ever saw was this season at Professor Sargent's place in Brookline, Mass. His veteran gardener, Mr. Sander, grew the plants from seed put in six years ago, and they certainly were grand and contained many shades of color among the flowers, yet all of them of that peculiar delicacy which is characteristic of the Japanese tree peonies.

Perhaps it is not generally known that *Paeonia moutan* is not known in its native state, nor is there any record of its having been found wild, so that it surely is one of the oldest garden plants in cultivation.

A RECORD BREAKER

GODFREY ASCHMANN of Philadelphia, the Well-known Araucaria Specialist of America

Watch Us Grow

1907 is now the twelfth year of our anniversary in a successful career in the importation, growing and shipping of that well-known and much admired evergreen decorative plant, the *Araucaria Excelsa*, *Compacta*, *Robusta* and the *Glaucous*. Beginning with the first year (1895) with an importation of 100, this year (Spring 1907) our importation has swollen up to the enormous quantity of 6,000 in the well-known, three best varieties, the *Araucaria Excelsa*, *Compacta*, *Robusta* and the *Glaucous*. Our *Araucarias* are so well introduced that at the present time they represent every city, county and state of America, so far as Cuba and Mexico, and from the Atlantic to the Pacific Ocean. It is always my earnest desire to improve my system in buying, raising, selling and shipping our production to such an extent, that it not only benefits ourselves, but so that it will yield a fair profit into the pockets of our buyers. Now is your chance and the time to fill your empty houses and make money fast, as the plants will grow into money while you sleep.

ARAUCARIA Excelsa, 5 in. pots, 10-12 in. high, 3 tiers, 2 years old, 50c. each; larger sizes, 5-5½ and 6 in. pots, 2-3-4 years old, 60c.-75c.-\$1.00 to \$1.25 each.

Cash with order please.

F. DORNER & SONS CO.

LAFAYETTE, IND.

St. Louis, Mo.**News Notes.**

We had with us this past week L. Baumann of Chicago selling supplies, in company with A. L. Barnett of Reed & Keller, New York, and J. B. O'Neil of Vaughan's, Chicago, spending the fourth of July. They all report a good business trip.

George Augermuller and his family will this season spend their vacation in Denver, Col. His brother Fred takes his vacation next week.

Carl Beyer is up and around, having recovered from his recent injuries. He says you cannot keep a good man down; "watch me in some of those jumping events at the florists' outing on the 25th."

It has been reported that the Eggeling Floral Company has purchased a tract of 120 acres of land in the country, on which they will build a range of houses this Summer to grow stock for their own use to supply their fast growing business. Their store on South and Grand avenues and the one at Delmar and King's Highway have had a good season.

Mr. and Mrs. Walter Weber of the H. J. Weber & Sons Nursery spent the past week in Chicago looking over all the large places in that city. They got back Friday and report having had a splendid time.

The downtown florists report a great sale on sweet peas the past week; they are the heaviest buyers at the wholesale houses.

Adolph Freamal, foreman at Brix's greenhouses, was recently married to Miss Olga Brix, a niece of his employer. Mr. Brix has a new store manager in the person of Joe Weckack, late of Carlsbad, Germany.

W. C. Smith and Frank Weber visited Romana Park Sunday to perfect all arrangements for the florists' picnic on the 25th of this month.

There is a great deal of talk going the rounds at the different wholesale houses as to who will be the umpire for the big event at the florists' picnic. The name of Ed. Winterson of Chicago has been mentioned, and it would not be surprising to see smiling Ed. at the grounds when it is time to call "play ball."

Secretary Beneke reports that the August meeting of the Florists' Club will be held at Shaw's Garden, August 8, and that the members will be the guests of President Irish and Professor Trelease. The election of officers will take place at this meeting, and it is hoped that the entire membership will take advantage of this the first outdoor meeting this Summer.

REVIEW OF THE MARKET

NEW YORK.—It is a peculiar condition that the wholesale flower dealers are up against just now. Perhaps never before were there shipped such immense supplies of stock in July, and never before was the demand from retailers smaller than at the present time. It is certainly a problem what to do with all the stock that is being received. Several are free to confess that not 25 per cent. of the flowers can be sold, no matter what price they are offered at, and it would seem that, seeing the returns going to the growers of late would be such as would convince them that it was not profitable to ship such immense quantities at this time, they would at least reduce their output to some extent.

So far as prices on flowers go, it can hardly be said that there are any. Either roses or carnations, with the exception of American Beauty, can be bought at 25c. per 100, if one wants to take them in quantity. For such flowers as phlox, stocks, cornflowers, snapdragons, sweet peas, lily of the valley, etc., there is actually no demand, except in very small lots. Gladiolus are coming in more plentifully every day, and this week has seen a good supply of Lillium candidum, which was offered at \$1 per 100. Longiflorum lilies are not so abundant as they were, still there seems to be plenty for the demand. Cattleyas sell occasionally, but strenuous efforts are made to keep the prices where they belong.

In addition to the regular run, there has been on the market a good supply of outdoor roses, particularly General Jacqueminot and moss roses. Time was when there was a dearth of cut flowers in this market during July, but it would seem that such a thing can not happen again. Every day, Winter or Summer, brings a heavy supply into the hands of the dealers. If buyers for the stock could be found as easy, what a money making business we would have!

CHICAGO.—Although there is practically nothing in general lines in the market that can conscientiously be classed as fancy, it is probably true that there are more good carnations arriving daily by a very large margin than were ever seen here at this season before and a continual glut of lower grades, which are lobbied off at very low prices, seems to hold the market in its clutches. Roses hold in about the same condition as to price and quality, though some good shipments are coming in, the crop from young stock already having made its appearance, in some cases in good form.

Though some dealers seem to incline to the impression that the market was never quite so flat as at present, it is probably safe to assert that on the whole conditions are about normal.

Sweet peas are over abundant. Asters have made their appearance in small quantities, but are promised soon in more abundant supply, though the general report seems to indicate that the crop will be late this year.

W. K. W.

BOSTON.—There is no change in market conditions; it is the same humdrum dullness of the Summer season. There is plenty of material, and prices are low. Roses are not of the best; they seldom go over 4c. and the majority at less. Of course, there are a few that reach nearly twice that figure but not many. The best carnations bring a dollar and plenty of them half or quarter that figure. Sweet peas are in their element at from 15c up to 50c. Gladiolus are plentiful at 4c. and 6c. Lily of the valley has a fair demand at from \$1.50 to \$4. Lots of other flowers are seen, but at prices that will not bear quoting. J. W. D.

WASHINGTON.—This city has been in the grasp of a torrid wave for several days; on Monday the thermometer climbed to 99 degrees. Such conditions depress business, but, per contra, there has been a temporary activity caused by several weddings and funerals among the more prominent class.

This week marks the passing of the greenhouse carnation for the season and the intense heat is relieving the glutted market of sweet peas. Almost all classes of field crops still show evidences of the late Spring and are backward accordingly. Corn has been sunted and does not seem to respond to high temperatures. J. L. C.

INDIANAPOLIS.—Business has quieted down to the regular Summer routine. Funeral work constitutes at least ninety per cent. of the trade; the remainder is regular counter demand. The mainstays of the flower stock are not nearly so popular as are well-grown field flowers or novelties, a fine bunch of forget-me-nots or heliotrope selling better than select roses or carnations. The last mentioned are extremely numerous and are shipped to distant points at \$1 to \$1.50 per hundred. Some excellent roses are received from Illinois; these consist of Kaiserin Augusta Victoria, La France and Killarney, at \$6 to \$8 per hundred. The local growers are emptying their rose benches and the supply is inadequate.

Auratum and cold storage Harrisii lilies in quantity are useful in flower arrangements, selling at \$12.50 to \$15 per hundred.

Heavy rains have temporarily spoiled the sweet pea crop; thousands are vainly offered at 20c. to 50c. a hundred, but few of them are handled as they cannot be kept over night successfully. Shasta daisies are much in evidence at \$1 per hundred. Asters are more plentiful, but the crop is several weeks off. A few dahlias exchange hands readily at \$2 per hundred.

Anything good in blooming plants is always welcome as retail patronage is not lacking. I. B.

ST. LOUIS.—The market is still very quiet, but sufficiently active to consume all of the first-class stock that comes in in limited quantities. Trade among the retailers was dull the past week, although several had a good deal of funeral work which was made up at good profit owing to stock being plentiful and cheap in the second and third grades.

The greenhouse men are keeping themselves busy with replanting and remodeling; there is also a great deal of building going on at Kirkwood, where nearly all the growers are building one or two new houses.

It has been a very hard matter of late to get correct quotations on cut stock at the different commission houses. The best in roses bring from \$4 to \$5 per 100. These are Souvenir du President Carnot, Ivory, Killarney and No. 51 sent in by Heller Brothers of Newcastle, Ind. Carnations hardly go over \$1.50 per 100 for the best, and 75c. to \$1 for second choice; these are becoming very small.

Sweet peas fetch not over \$1 per 100 for the very best; they are a glut, but seem to sell well at this price for window decorations. There is plenty of other outdoor stock in the market, also plenty of everything in greens. ST. PATRICK.

CINCINNATI.—Summer dullness is now with us, and while there is always a little doing, we cannot say business is good. The wholesale houses now generally close at 5 p. m., and will do so during July and August. At the present time one can find Bride and Bridesmaid roses, fair stock of carnations, sweet peas, daisies, gladiolus, lily of the valley, lilies, green galax leaves, smilax, Asparagus Sprengeri and ferns. These with a few American Beauty roses constitute the stock coming to this market. Never before have I seen so many fine sweet peas, and never were they sold so cheap as now, the street merchants handling most of the stock. Good asters will be welcomed a little later.

Seedsmen report their business holding up unusually well. E. G. G.

CHANGES IN BUSINESS.

POUGHKEEPSIE, N. Y.—The "Saltford Flower Shop" has been incorporated; capital, \$5,000. The directors are W. G. Saltford, W. Arthur Saltford, and George C. Saltford.

AUSTIN, TEX.—The El Paso Horticultural Company has been incorporated; capital stock, \$5,000. Incorporators: D. W. Schoonmaker, R. M. Mays, T. E. Shelton and M. W. Stanton.

SHERMAN, TEXAS.—E. Otto Pfizner, of Dallas, has been in this city looking over the ground with a view to starting in the florist business.

DAVENPORT, IA.—C. W. Sandstrom of Moline has bought the interest in the flower store in the Moline theatre

THE METAIRIE RIDGE NURSERY COMPANY LTD

Oncidium Varicosum
Rogersii

ONE of the most profitable florists' orchids; easy of growth. To clear an import, we offer a lot of strong plants, small, 3-4 bulbs, but surely flowering, at \$4.00 per dozen; each, 40c.

Try a few; it will pay

H. H. BERGER & CO., 70 Warren St., New York

formerly held by Mrs. H. W. Hurst, wife of the proprietor.

DE PERE, WIS.—F. Woback has retired from the firm of Buth & Woback, the East side florists, and is succeeded by Peter Shea, son of Marshall Shea. The name of the new firm is Buth & Shea.

MANDAN, N. D.—W. L. Taylor, an experienced nurseryman of Southern Minnesota, has purchased 20 acres of land west of and adjoining the city limits for nursery purposes. Mr. Taylor has been for years engaged in that line of business, having owned the Howard Lake and Litchville, Minnesota, nurseries, and has held the office of president of the Minnesota State Horticultural association, for a number of years. He has associated with him in the business his son-in-law, J. B. Saunders, who with his wife will make Mandan their future home.

SALEM, MASS.—Walter S. Fowle, a lifelong resident of Danvers, has bought Henry B. Larnard's interest in the firm of Larnard & Shirley, proprietors of the well-known Walnut Grove greenhouses. This name will be retained and the new firm will be known as Shirley & Fowle. Mr. Larnard retires because of ill health, after highly creditable and successful connection with the enterprise since it was established several years ago.

Messrs. Shirley & Fowle are negotiating for four house lots on Ash street, between Hampshire and Fowler streets, where the greenhouses will be located. Another large building will be erected, to be used for the growing of carnations. A good-sized potting shed and storage building will also be constructed and later it is contemplated to build a rose house.

FIRMS WHO ARE BUILDING.

DOVER, N. H.—Charles A. Davis is building a greenhouse, 100x30 feet.

PHILADELPHIA, PA.—J. W. Colless has secured a permit to erect a new greenhouse at Fifty-third street, south of Woodland avenue; cost, \$300.

ATHOL, MASS.—George W. Sutherland has begun work on a new greenhouse, to be 100 feet long and 17 wide. It will be used mostly for raising chrysanthemums. This will make six large greenhouses on his place.

PEORIA, ILL.—Dr. O. T. Dwinell, pastor of the First Methodist Episcopal church in this city, in an address before the 200 members of the Illinois Undertakers' Association, suggested sane funerals, house services, no flowers, no singers, a prayer, a few words by the minister, no "last look" at the corpse, and no show at the grave.

10,000 VINCAS—5,000 ROSES

Fine Vincas, from 2 1/2 in. at \$2.50 per 100; or \$22.50 per 1000.

BRIDE and BRIDESMAID ROSES, from 2 in. pots, at \$4.00 per 100; or \$35.00 per 1000. Good stock. Cash with order.

W. T. HILLBORN, STATE STREET NEWTOWN, PA. GARDENS.

CANNAS

Two Great Gold Medal CANNAS, King Humbert, \$10.00 per 100. Mrs. Wm. Kastling, \$8.00 per 100. Egandale and Brandywine, \$6.00 per 100. Crimsan Bedder, a superb handsome bedder, \$5.00 per 100. All the above A No. 1 stock, out of 3 1/2 inch pots. Cash.

A. CORLIN, - ELBERON, N. J.

CHRYSANTHEMUMS

SURPLUS STOCK.

1,500 Ivory, pink and white; 500 Mrs. Perrin; 250 W. H. Lincoln; 500 H. W. Riemann, \$2.00 per 100. Cash with order, please.

JOHN WHITE,

ELIZABETH, N. J.

CANUTE, Kan.—The Canute Nurseries were established in 1878 by James Truitt, in a small way. Mr. Truitt had spent the best years of his life in the study of horticulture, and he knew how to make the best use of his energies, of which he had an abundant supply. A greenhouse department was added. Later on the three sons, as they grew to maturity, became associated with the business.

The growing nursery stock covers hundreds of acres of fertile land and the packing houses are among the largest in the country. Within the past year the firm has found it necessary to double the greenhouse plant and to erect a new packing house 225 feet long by 100 feet wide in order to handle its increasing trade.

The main packing house is located at the head of North Lincoln avenue, and the greenhouses at the corner of Walnut and North Steuben.

News Notes.

There will be no further change of dates of the shows of the Massachusetts Horticultural Society this season. The date set for the sweet pea exhibition is July 20 as formerly announced, and there will be no exhibition the week following, which happens to be Old Home week, and at which time a contemporary announced a two days' exhibition.

W. C. Stickel of Lexington is rebuilding and enlarging one of his houses.

W. W. Rawson & Company have issued a circular inviting those interested to visit their dahlia farm and sweet pea trial grounds at Marblehead on Saturday, July 27, (Old Home week). The location is on Green street, Marblehead, five minutes' walk from the station. There are lots of trains leaving Boston, North Station, or the trip may be made by trolley, leaving Scollay square every thirty minutes.

C. E. Holbrow and F. W. Holbrow are summering at Manet Beach with their families. George Cartwright also has a cottage at this resort.

S. J. Goddard is building a small house between his recently erected large houses. J. W. DUNCAN.

COLUMBUS, O.—The Fifth Avenue Floral Company has increased its capital stock from \$20,000 to \$50,000. Of this increase \$19,000 is to be issued as 6 per cent. preferred stock.

CADILLAC, MICH.—A. W. Tweedie, florist, is another American who has been assured that a fortune awaits him if he will help one Manuel Lopez get out of a Spanish prison. Tweedie is not lured by the promise of a third of \$400,000.

Visitors to the Elks and S. A. F. Conventions

To all FLORISTS and members of allied trades, the S. S. PENNOCK-MEEHAN CO. extend a cordial invitation to make their headquarters with them where telephones, stenographers and general information regarding points of interest, etc., will be at their command.

 Trade Notes.

Business is very quiet this week. On every street we notice preparations going on for the Elks' convention, but the work is all being done with flags and bunting; the only exception to this is the wreathing on the Court of Honor on Broad street for which the William Graham Company have the contract.

Carnation growers will be interested in the matter of indoor grown plants. William Kleinheinz, gardener to Mr. P. A. B. Widener, who has been so successful in growing his plants entirely indoors in pots, will plant his out in the benches this week. This time he propagated in December, having found that December cuttings were preferable to those taken in January for pot culture. His plants this year are 8 inches through and 10 inches high—the best he ever had; potted from cutting bench into thumb pots, then into 3-inch, and are now in 4-inch pots.

The sweet pea show of the Pennsylvania Horticultural Society this week was a very good one; over 400 vases of sweet peas were staged, and over 300 vases of perennials. The show was open to the public and was well attended. The new varieties Gladys Unwin, Frank Dolby, Nora Unwin, and Evelyn Byatt were much admired. The competition was very keen in all classes, there being seven and eight entries in the sweet peas classes and four in each of the hardy perennial classes. The Japanese irises were very attractive, the first and second prize entries having grand flowers of very distinct varieties. Prizes were offered by Henry F. Michell Company, Henry A. Dreer, Inc., Harrison & Schrieber, landscape architects, and H. Waterer. Quality of flowers took first in all classes. Many exhibitors cut their vines down to get a display, but the judges recognized the flower every time.

DAVID RUST.

ROSS, CAL.—The preliminary premium list of the Marine County Horticultural Society, which has just been issued, promises well for the success of the society's annual show in October. Prizes approximating \$500 in cash, cups and medals are offered. What should interest the carnation man in other parts is the offer of \$25 cash, or a gold medal, for the best 12 carnation blooms. This is not open to California growers. Premium lists will be mailed on application to T. P. Redmayne, Secretary, Hotel Rafael, San Rafael Cal. J. H.

MANILA, P. I.—Dell's Floral depot has put in a line of Moro curios of all kinds and will add from time to time, curios from all parts of the Islands.

run out of the first one he entered by the proprietor James Farrell, an old-time retailer, but persistence was victorious, a successful route was established and conducted for some time and as the plan prospered a horse and phaeton were added to the equipment and a much larger territory covered.

Results are now in sight from the act passed by the last session of the legislature, of this State appropriating the sum of \$15,000, one half of which is available this year, the remainder next year, for the specific purpose of conducting experimental work in controlling insect enemies and diseases of plants and vegetables grown under glass. While many States conduct successful experiment stations this is said to be the first instance of a state legislation making an appropriation, the disbursement of which is for the purpose of directly aiding the florist and greenhouse vegetable grower in fighting their most persistent adversaries. The application of this appropriation is in the hands of a committee which under the law is appointed by the executive committee of the Illinois State Florists' Association to act with the Director of the State Experiment Station and is constituted as follows: Director Davenport, chairman, and J. F. Ammann, J. Heintz, C. D. Gallantine, W. N. Rudd, and J. C. Vaughan. At the first meeting of the committee recently held in Champaign, Ill., a portion of the allotted sum was set aside for building purposes; a careful survey of the field was ordered to decide the relative importance of the subjects to be taken up from a commercial standpoint and otherwise, and thrips was selected as the first enemy to be scientifically assailed.

The passage of this law may be credited to three years' disinterested work of quite a number of Illinois florists who at their own expense have visited the State Capitol to impress upon the lawmakers the importance of horticultural pursuits, and to the endeavors of clubs and societies throughout the State which have exerted themselves in the same direction and made their influence felt.

While five o'clock closing is the rule among the wholesalers, late orders not infrequently keep part of the force of many stores on deck an hour over time.

Thomas Murphy, who was connected with one of the railroads as yard master and also ran a flower store at 643 Ogden avenue, committed suicide sometime during the night of July 4, his body being found Friday morning with two bullet holes through the head and the gas turned on in the room. The deceased was a man of genial disposition, of exemplary habits, prosperous in business and no cause can be given for his rash act. Mrs. Murphy was at the time spending a few days with relatives, he being alone in the house and was last seen by friends at about 8 o'clock Thursday evening. Mr. Murphy was a thirty-second degree Mason and was buried with the honors of the fraternity.

Sunday hours prevailed with the wholesale houses on Thursday of last week, July 4, nearly all being closed by noon or soon after.

Stock taking in the supply department of the A. L. Randall Company has been completed and the year's business is reported as very gratifying.

J. B. Deamud while returning to his home from the business section in the early afternoon of July 4, met with a street car accident which fortunately was less serious in its results than was the case with other passengers sitting near. He was occupying the inside end seat of an open car and while on the curve at the corner of Wabash avenue and Twenty-second street another car attempted to round the corner going in the other direction, in defiance of the company's rules, the rear end swinging around and crashing into the car occupied by Mr. Deamud. He was struck in the left arm, which was put out of commission, and otherwise shaken up, but no bones were broken.

The Week's News.

W. P. Kyle spent the greater part of last week in Northern Michigan where he was accompanied by his son.

H. E. Klunder reports a special call for his fancy water lilies for lunch decorations at the various golf club houses.

Otto Frees of the Poehlmann Brothers Company's city staff started on Saturday last on his annual vacation which will be spent in his usually preferred manner with his family taking extemporaneous trips of a day or two in such direction as fancy dictates. Mr. Frees though still in his prime in thoughts, looks and action, may be termed the father of the wholesale cut flower business in Chicago with its present small army of adherents, and when in a reminiscent mood interestingly relates how when he was a boy employed by J. C. Vaughan some of the out of town growers sent small lots of cut flowers to the store to be sold on commission if possible. The consignments consisted of short stemmed carnations and little bunches of stocks, heliotropes, etc., such as composed the general greenhouse assortment of twenty-five years ago. When the young salesman started out with a basket on each arm to make the rounds of the nearby stores he was literally

A. T. De La Mare Ptg. & Co. Ltd., New York

is about to re-enter the florist business and intends to build a house 18x170 feet this season.

The H. M. Hooker Company, glass merchants, have leased for 98 years and 8 months the property at 120 to 126 West Washington street at a yearly rental of \$4,660, with a provision that they will erect thereon a building to cost not less than \$100,000.

Charles Erne and Michael Tribble of the E. H. Hunt store are enjoying their annual vacation.

The annual picnic of the Florists' Club, which will be held Sunday, July 21, bids fair to be a grand success.

The committees' reports are all very favorable and the unanimity of expressed pleasant anticipation and willing co-operation on all sides presage an enjoyable affair. The picnic train will leave on the C. M. & St. P. railroad, Adams street station, at 9:30 a. m. and later trains at 12:40 and 2:00 o'clock, will accommodate those who cannot take the earlier train.

C. M. Dickinson, with Mrs. Dickinson and family, is rustication among the lakes of Northern Wisconsin.

Recent visitors included Mr. and Mrs. Wachenheim, Vicksburg, Miss.; W. A. Hartman, South Haven, Mich.; C. H. Frey, Lincoln, Neb.; J. L. Johnson, De Kalb, Ill.; B. Rosens, New York.

T. Argison and D. Papatony, who for some time have had a stand on the corner of Fifth avenue and Randolph street, have leased the store in the building at 55 Fifth avenue, which will be thoroughly equipped and furnished, the concern to be known as the Briggs' House Florists.

WILLIAM K. WOOD.

Rochester, N. Y.

Trade Notes.

Now that the Summer season is here in full earnest, its effect is felt in the decline of business in the stores. Steps have been taken looking to the closing of the stores on Saturday at 1 o'clock during July and August, but there is such a diversity of opinion among the proprietors that nothing definite has been accomplished. Some greenhouse firms, too, are willing and do give their employees an extra hour or so of leisure on Saturday afternoon, but lack of uniformity, or of association or short-sightedness, keeps many plugging away for 10 hours—6 days per week. Would a florists' club be of any assistance in this respect?

Flowers of all kinds are a glut in the market, and but for the fact of the Greeks and grocery stores handling a considerable quantity, much would be consigned to waste. Especially is this true of sweet peas, prices for which are certainly discouraging—one cent per bunch for even best grades being all that is received. Carnations for this time of year are exceptionally good, but so much other material is available that 35c. to 50c. per 100 is considered a fair price.

THE AMERICAN CARNATION

All firms agree that the season has been a remarkable one for plants for bedding out, J. B. Keller Sons and Salter Brothers having had to buy several thousands of plants over and above their usual output.

The experimental cement benches, used by Salter Brothers, and supplied by a Buffalo firm, have not met with such a decided success, but with continued improvement they hope soon to overcome the present difficulties.

J. B. Keller Sons, who are extensive growers of herbaceous plants, have a fine stock of the beautiful double white Campanula Moerhousii, which as seen in their grounds presents a glorious show. Also worthy of notice is a large batch of "King of Delphiniums," in bloom perhaps a little early and short on account of dry season; but under satisfactory conditions it reaches a height of 8 feet. It is semi-double, blue, and does not give any seed pods, consequently increase of stock is by division of roots.

The seed men are anxiously waiting the coming into bloom of a new aster, grown by Frank Purcell, and now in its third year. From the description given at this writing, it is an aster of the Semple class, Enchantress carnation color, very double, petals reflex, and having on the under side a silvery hue, presenting a grand sight when fully expanded. Stems are from 18 to 24 inches long when grown under favorable conditions.

William Henckell at the City Parks Greenhouses, is receiving the congratulations of the craft on his approaching marriage to a charming widow, the happy event to take place in September.

COCKNEY.

Binghamton, N. Y.

James B. Tully is the veteran florist of Binghamton. He has been in business in the same location since 1875. Although considerably advanced in years Mr. Tully is both hale and hearty, and desires all his friends in the trade to know it. He says he was reported to be dead last November, but it was another Tully who died. Mr. Tully has a nice location close to Spring Forest cemetery; his plant will have a general overhauling and repairing the present season. New benches and boilers are to be put in and the entire place will be in the best condition by early Fall.

Geo. L. Meacham, supt. of Spring Forest Cemetery, has recently completed a new greenhouse for the Cemetery Company. This will be used for bedding plants for sale to the patrons of the cemetery. More houses will be added this Summer for cut flower growing; two of them are already well under way. The houses are all to be on the cemetery property and will be run on a commercial basis for the benefit of the stockholders.

H. Hopkins is the only wholesale man in the city. He has a handsome though not extensive range on Floral avenue. This season he is adding another house and replacing the outer walk and foundation of his other houses with concrete; when completed he will have a very handsome as well as convenient establishment.

Wm. Graham has a handsome city store on Washington street, with greenhouses in the rear for palms and decorative stock. Mr. Graham enjoys a good trade. He has greenhouses also on Floral avenue.

Augustus Osier has a city store on Court street where he secures a good share of the going trade. He has no greenhouses.

The greenhouses of Mrs. M. F. Barnes, known as the Oak street greenhouses, were some time ago purchased by C. H. Wilbur, who conducts them in a business like way.

Mr. Decker has recently started in business with a couple of greenhouses on Clinton street.

A. E. Fancher says all the Spring business has been crowded into three weeks on account of the late season, and made it very difficult to handle satisfactorily.

J. M.

Prices Advertised in these Columns are for THE TRADE ONLY—When Writing Please Mention THE FLORISTS' EXCHANGE.

Auburn, N. Y.

Geo. T. Clark is giving his greenhouses a complete overhauling and will have everything in good shape by carnation planting time.

The Chas. Wride greenhouses that were sold some time ago to Dahn & Ford are now owned exclusively by R. Dahn, Mr. Ford retiring from the business.

George Dobbs & Son operate the greenhouses on the estate of D. M. Dunning. The graperies is reserved for the family use; the other houses all of which are in good shape, are devoted to cut flower growing for commercial purposes and operated by Dobbs & Son to good advantage.

A. Patrick has possibly the best commercial lot of glass in the city. His square of perennials, in full bloom, on the corner of one of the principal residence streets was attracting favorable comment.

Thos. Hicks & Son have a good stand on Owasco street. They are considering many improvements in the near future. Business has been good.

Heibert M. Hills, who went into the greenhouse business on account of his health, is entirely pleased with his change. He keeps a competent florist in charge of his place, and does all the delivering and light outdoor work himself. He says he is regaining health and has found a pleasant as well as a profitable occupation besides.

J. Elletson is one of the oldest florists in this city. He has grown up with the business in Auburn and has seen many comers and goers. He has a nice place at 106 Franklin street, and works daily at the business for the love he has for it. Mr. Elletson has been quite successful and is regarded as a prosperous citizen.

J. M.

Watertown, N. Y.

Fred. Avery is adding a house for roses to his establishment on Flower avenue.

Wm. A. Clark & Sons report a very good trade, and seem entirely satisfied with the season's business. Improvements and repairing are having consideration.

G. H. Underhill has one of the handsomest stores in Northern New York. His stand is on the city square fronting a beautiful piece of parkway.

A. Stoeckle is the most extensive grower in Watertown; he also has a store on Stone street. Last season he erected several houses for carnations, part of which he did not have time to finish. The present season will see them all completed by planting time. Mr. Stoeckle is also installing a large steam boiler and adding a boiler room.

F. A. Bennett & Son report a growing business. The demand for stock in all lines was said to be continually on the increase.

J. M.

Geneva, N. Y.

This is more of a city of nurserymen than of florists. Thousands of acres in this vicinity are devoted to nursery stock of all kinds.

W. & T. Smith has for many years very successfully combined the florist and nursery trades. They grow cut flowers and hedging plants extensively for both the local and wholesale market. In addition to this they have about 40 acres in a choice line of ornamental stock making a specialty of cut-leaved birch. Their field of roses was looking fine.

In all the nurseries visited in this section, where roses are grown, Frau Karl Druschki seemed to be head and shoulders above all competitors. The demand for this rose another year is predicted to be very large.

Smith & Gannett, with greenhouses at Border City, a short distance out on the car line, are also carnation growers, and have quite an area of glass part of which is entirely new. Field grown plants are raised for the wholesale trade. The firm has an attractive city store.

B. HAMMOND, - Fishkill-on-Hudson, N. Y.

Corning, N. Y.

The Washington Rawley greenhouses at this place have been purchased by Dr. A. M. Breed and have been greatly improved; considerable new stock has been added. Frank H. Whitney is manager and reports trade good in all lines.

A. H. Woepfel has moved his entire plant from Fourth street to a splendid location on Park avenue. It is in front of Hope cemetery. The houses are all new. Mr. Woepfel has quite recently added a new office building of hardwood finish that would do credit to a larger city than Corning. Miss Woepfel presides over the duties of the office and makes a valuable assistant to her father in design work, and accounts.

J. M.

Waterloo, N. Y.

Chas. Fillingham has decided to abandon the greenhouse business that for some time past he was engaged in as a side issue. Mr. Fillingham holds a good position in one of the large manufacturing concerns of Waterloo and will give his entire time to that in future.

Smith & Kuney have a good stand close to the cemetery on Stark street, and will hereafter have the entire field to themselves in cut flowers and plants. There are several extensive nurseries in the vicinity.

H & CO

A Good Start Off

you know is more than half the proposition. Suppose for instance, it is a case of a boiler you have been using that seemed to do the work economically, and you have just about made up your mind to put in others like it. Now just wait a minute: what do you know about the H & Co. Sectional or Corrugated Firebox Boiler, and the work they do and the coal they burn in doing it? Have you had right down, fair and square talks with men who use them? Not only use them, but have tried them side by side with others, and know pretty near what they are talking about. A sure way of getting at the bottom of the question. We would like to put you in touch with a few such men. Time enough then to make your decision. Send for catalog.

EMIL GLAUBER, Montclair, Colo.

New Orleans, La.

News Notes.

At the Metairie Ridge Nurseries they have just finished planting the rose houses, which look very promising. The chrysanthemums in benches as well as those in the open field are of sturdy, even growth. One of the sights at this place is a house of callas with the sash removed, which after being profitable the whole Winter and Spring is still producing profuse quantities of extra-sized blooms. A batch of good-sized Areca lutescens, planted in the open field, full exposure, seemed to resent such treatment at first by turning yellow, but are now making good clean growth that will be so well matured as to assure them standing plenty of knocking about during the Winter; in addition to these they have an acre or two of hardy palms, such as washingtonias, phoenix, chameleons, Cocos australis, etc.

Abele Brothers are cutting large quantities of Triumph daisies; (Chrysanthemum maximum); this is found to be much more satisfactory here than the Shasta and its varieties.

From present indications the crop of Latania borbonica seed in this city will be something immense the coming Fall. This is the most prolific of all our hardy palms.

Reinhard Cook of the firm of M. Cook's Sons is the happy father of a boy.

Miss Kate Rehm with the Misses Virgin, left during the past week for a trip to Canada and on their way home will be the guests of Mr. and Mrs. Chas. McKellar of Chicago.

CRESCENT CITY.

NEW ORLEANS, LA.—Joseph A. Schindler, the well-known florist, left New Orleans on the Proteus July 6 for an extended business trip to New York, Philadelphia, Washington, Jamestown, Detroit, St. Louis etc. He will be accompanied by his son, Antoine.

Cincinnati, O.

News Notes.

The great and glorious Fourth has again passed into history, without any deaths being recorded in this great city of Cincinnati. The usual number of outings took place, but more prominent than others was the annual reunion of the Murphys and their close friends, held at the residence of Joseph Murphy, nearly one hundred people being present. The baseball games, two in number, captained by George Murphy and Edward Murphy, were special features, and honors were equally divided, the score being something like 75 and 25 in one and 45 and 35 in the other. Fireworks in the evening, and many good things to eat, helped the day to pass only too quickly. The umpires were William Murphy and Thomas Windram.

Nothing has been said or done regarding the florists' annual outing, which usually takes place July 25, but as the annual meeting of the Cincinnati Florists' Society will be held July 13, no doubt some action will be taken. John A. Evans was in the city Friday booking orders for his celebrated Twentieth Century Challenge machine.

WHATEVER you decide about boilers,
don't be talked into thinking that
one immense boiler is cheaper to operate
than 3 or 4 of an economical size.

That is, if you connect them up "Burnham way" in battery. Just listen a minute and see if our argument isn't good sense:—

With one immense boiler you have to run all that boiler all the time, in all weathers. In the early fall and spring when only a little fire is wanted, it's bound to be an unwieldy, coal eating proposition. Now, suppose you had two or three "Burnhams" in battery; then you could run exactly as much grate surface as needed.

Some days only one boiler would do the work and the fire in one of the others be banked or out altogether. With the "Burnham Way" you have the whole situation under perfect and economical control. We would like very much to give you some proven out facts on battery work. Write us.

AMERICAN SEED TRADE ASSOCIATION

George S. Green, Chicago, Ill., president; M. H. Duryea, New York, first vice-president; F. W. Bolgiano, Baltimore, Md., second vice-president; C. E. Kendel, Cleveland, O., secretary and treasurer; Leonard Vaughan, Chicago, assistant secretary.

CHICAGO.—J. S. Michael of the Sioux City Seed and Nursery Company, Sioux City, Ia., accompanied by Mrs. Michael, was in Chicago last week on the way home from the convention in New York. J. C. Robinson of Waterloo, Neb., was also a visitor and Mr. Wood of Wood, Stubbs & Company, Louisville, Ky., has been spending a few days here. W. K. W.

IMPORTS OF SEEDS, ETC.—July 1.—Jamestown Exposition, four tubs live plants, two barrels plants, one box plants; Maltus & Ware, 12 cases orchids; C. C. Villegas, 46 boxes plants. July 2.—R. Hillier's Sons Company, eight bags seeds, eight bushels roots; Maltus & Ware, eight tubs plants. July 3.—J. W. Hampton, Jr. & Company, three cases plants, 12 tubs laurel trees; Maltus & Ware, one case plants; Smith & Bolzenthal, one case plants. July 6 and 7.—H. F. Darrow, 39 packages seeds. July 9.—McIntichison & Company, six tubs laurel trees; Smith & Bolzenthal, seven cases plants; J. M. Thorburn & Company, two bags seeds. July 10.—Maltus & Ware, 100 cases wild plants. July 12.—A. E. Outerbridge & Company, 107 cases lily bulbs; F. B. Vandegrift & Company, 45 bags clover seed.

European Notes.

This week's notes must certainly be in the minor key, for anything more dispiriting than the cold winds and soaking rains, which persist for 24 hours at a stretch, it is not easy to imagine. In the meantime, such of our plants as are not buried in mud continue to make a very vigorous leaf and stem growth, but the flowers are lacking. Of course, it is not yet too late for a crop, especially of late ripening articles, but such delicate crops as cucumbers and other Cucurbitaceae must of necessity be short.

Radish, where it was sown early and transplanted, is making a good stand, particularly in England and Germany. Better treatment would have produced better results also in France.

Onion and leek are in a very sappy condition and are not improving. A very hot spell would, it is feared, quickly develop mildew, and the sorts for which inquiries reach us from your side would suffer the most.

The crops which cause the most anxiety just now are lettuce and spinach. Of the latter article varieties like Bloomsdale should now be ready to harvest on early land, but it is quite green and full of growth. The French growers hold the market at present.

Dwarf and pole beans have suffered much during the past eight days, but a slowly rising barometer gives us hope of better times.

American seedsmen in Europe include W. H. Maule at Hotel Carlton, London; C. C. Massie of Northrup, King & Company, Minnesota. Mr. and Mrs. W. Atlee Burpee and sons are having a good time in Germany, and J. Charles McCullough is expected daily on the S.S. Deutschland. EUROPEAN SEEDS.

When Writing Please Mention THE FLORISTS' EXCHANGE.

A Good Cucumber.

The cucumber illustrated herewith is from the strain of Arlington White Spine, for forcing, and was grown by one of the most prosperous market gardeners in Arlington—Wyman Brothers. They are specialists in this line and it is very remarkable to see four good, first-class cucumbers growing in one cluster. Oftentimes, we have been able to find two perfect ones or three very good ones, but never do we remember seeing four practically perfect ones.

This cucumber is being introduced by H. E. Fiske Seed Company, Boston, Mass.

A Bit of Vaudeville.

OSGAR AND ADOLF GIVE EACH OTHER POINTS ON EXPERT GARDENING.

"Vell, Osgar, vot vill we planting in der garten?"

"I tink, Adolf, we should planting some baking powder."

"Vot would id raise?"

"Doughnuts—ba, ha, ha!"

"Dit you read in der catalog vere id says early Lima limes intendet for couse-ryes should be forced in a conservatory?"

"Yess, Id also says dwarf horseradish iss soon curried."

"Don'd let me interruption you, bud I haf a stitch in my site from sowing dese seeds."

"Why, dose are seedless seeds!"

"Sure, I vant to grow some toe-less tomatoes und some webless spinach."

"I subbose you belief you are a expertness horticultural like Loofah Burbunk."

"Yess, I intention to cross a sunflower mit a night blooming cereus to get a morning glory."

"Vot are dose leedle shoots vich iss coming up?"

"Dose are 22-caliber poppies."

"Vell, don'd tease der flowers or you might irrigate dem."

"Too late. Here is alretty a plant vich iss madder."

"Ah, dere iss a veed in der garden alretty. Id iss a stogie vich you droppeded."

"Do you spray your gooseberry bushes?"

"Yess, bud only when dey haf ton-sillitis."

"A funny happen experienced itself to me. I haf a onion set und id hatched a egg plant."

"Dot iss noddings. I buried a Hubbard squash und id rose geranium—ha, ha, ha!"

"Mary, Mary, quite contrary, How does your garten grow?"

"Chestnut bells und oyster shells; Who wass it vished to know?"—

F. W. Schaefer in the Chicago Journal.

New Baby Smilax

(Myrsiphyllum Asparagoides Myrtifolia)

The old well-known Smilax has a rival in this new variety. It is of a delicate and handsome appearance; the individual leaves are only one-half as large as the regular smilax, and as graceful as the Maiden Hair Fern. It is advisable to allow each plant several strands of twine to run on. It is very fast growing and produces many more shoots than the old variety of Smilax.

1018 Market St., Philadelphia

PREPARE FOR CHRISTMAS

Novelties, always sell during the holidays. If you have not already grown them, try some Pink or Rose Speciosums. If potted in July, will flower for Thanksgiving and Christmas. Always useful either for cut flowers or plants. Ask the leading florists in Pittsburgh, Cleveland, Detroit, Buffalo, or around New York City. Order to-day. Will ship any time.

Cold storage Liliun longiflorums and giganteums take about two months to bloom from time of potting; speciosums from five to six months, so that longiflorums wanted for Thanksgiving and Christmas should be planted about Oct. 1, and speciosums in July.

All Cases are Re-packed Before Shipment

Liliun Longiflorum Giganteum, 7 to 9-in. bulbs, 300 in case, \$9.00 per 100, \$80.00 per 1000.	bulbs, 200 in case, \$8.00 per 100; \$75.00 per 1000; 9 to 11 in. bulbs, 150 in case, \$12.50 per 100; \$110.00 per 1000.
Liliun Longiflorum Multiflorum, 9 to 10-in. bulbs, 200 in case, \$11.00 per 100; \$100.00 per 1000.	Liliun Speciosum Melpomene, 8 to 9-in. bulbs, 200 in case, \$9.00 per 100; \$80.00 per 1000; 9 to 11-in. bulbs, 150 in case, \$12.00 per 100; \$115.00 per 1000.
Liliun Speciosum Robrum, 8 to 9-in.	

Full cases sold at 1000 rate.

ARTHUR T. BODDINGTON, 342 West 14th St., NEW YORK CITY.

California Plant Notes.

One of the errors of planters of ornamental stock on this coast is the mixing of drought-resistant varieties with those requiring plenty of water during our Summer months for their best development. Here we find on private grounds and public parks, collections of trees and shrubs from Australia and the desert regions of this coast, planted in the same borders or among the same groups with subjects native of humid

growth of wood so soft that a slight frost injures both foliage and flower, since its time of blooming is Midwinter, and a severe frost will kill it back sometimes to the ground. If grown dry, the foliage, which resembles that of the linden, is not so large as when watered freely, and the wood is hard enough to stand a low temperature and gives a wealth of white flowers, borne in clusters like those of the snowball. The plant is an evergreen. The same is true of bougainvilleas. If watered freely they

Strain of Forcing Cucumber Arlington White Spine

Wyman Bros., growers.

H. E. Fiske Seed Co., introducers.

regions of the world, and the result is anything but satisfactory to the lover of plant life who cares to see the most beautiful specimens of the different families represented. The temptation to do so is great. The list of plants that will grow to perfection in Southern California in the open is a long one, and it is difficult for the enthusiast to resist the impulse to deny himself the pleasure of having a beautiful subject that he may see growing on the grounds of his neighbor. If our native poppies—Dendromecon rigida, and Romneya Coulteri—be watered during the Summer, the treatment is sure death to the former, and a feeble growth and few if any flowers on the latter; yet they are planted in lawns and in shrubberies that are watered copiously at least once a week, and the grower wonders why they do not grow as luxuriantly and flower as freely as they do in the wild.

Hymenocallis flava, an Australian tree of small size, with luxuriant, dark green foliage, bearing a profusion of white fragrant flowers an inch in diameter, which turn yellow several days before dropping, will, if watered during the Summer, live a miserable sickly life, and be a disappointment to the grower.

Dorothy's excelsa is another subject of great beauty if not given any water other than it receives during our rainy season.

Sparmannia africana, if watered freely during the Summer, makes a prodigious

make an amazing growth and comparatively few flowers. On the other hand, such plants as the hedychiums, alpinias, the different varieties of colocasias, the cyperus family, seldom receive enough water and food to make fine specimens or give a profusion of bloom.

This phase of the gardener's art, it would seem, has not been given the study and thought its merits warrant on the part of the profession on this coast, and until this is done we may not hope to attain to that degree of perfection and point of excellence which climatic conditions make possible.

P. D. BARNHART.

COUNCIL BLUFFS, IA. — The Younkerman Seed Company has installed new seed cleaning machinery at a cost of about \$2,000, in an effort to comply with the pure seed law.

NURSERY DEPARTMENT.

Conducted by Joseph Meehan.

AMERICAN ASSOCIATION OF NURSEYRMEN.
J. W. Hill, Des Moines, Ia., president; C. M. Hobbs, Bridgeport, Ind., vice-president; George C. Seager, Rochester, N. Y., secretary; C. L. Yates, Rochester, N. Y., treasurer.

Seasonable Topics.

But few writers refer to the sweet odor of the white fringe, *Chionanthus virginica*. It is a very agreeable scent, and belongs alike to both the seed bearing and sterile forms. In this connection it may be mentioned that the sterile one has the larger racemes of flowers; on the other hand, there is the attraction of the seeds in the other.

Everyone familiar with vines knows the value of the *Clematis paniculata*. It is beautiful and flowers late. But there is abundant room for the old *Clematis flammula* as well, especially as it is in bloom in July, a month earlier than the other. Plant them both.

Australia is a big country, just as our own is, and there are parts of it where their famous eucalyptus trees cannot be grown. There is a mountain in New South Wales where the thermometer shows ten degrees below zero in Winter and where fifty degrees is the highest Summer temperature. Even in the south island of New Zealand all eucalyptuses will not grow, as ten to twenty degrees of frost is not uncommon in its Winter.

Climbing Clothilde Soupert rose is a failure here for flowering, but it has been used to good advantage as a stock for budding other sorts on. One within view now, carrying Gloire de Dijon from buds set over a year ago, as is a mass of flowers.

The cause of death of many of the *Sequoia gigantea* set out in the years past is not lack of hardiness, but the ravages of a fungus. This can be controlled by spraying with Bordeaux mixture. There is a tree in Philadelphia, 15 feet high, which thrives well because it is so sprayed every year.

The dogwood, *Cornus florida*, the hawthorn and some other hard shelled seeds if washed free of pulp in Autumn and sown at once germinate very well when Spring arrives. If not sown until Spring, they rarely grow under twelve months.

The Fruiting Form of Paper Mulberry.

How trees will spread from a small beginning is well illustrated in the case of the paper mulberry, *Broussonetia papyrifera*. This has been known in Philadelphia as a street tree for over 75 years, and although not often used for a similar purpose now, it is common to see it here and there in collections. The whole of the trees referred to are of the male type, or were up to a year or two ago. At least the writer never knew of one that was fruit bearing in all the years of his residence in the city until other trees were introduced a few years ago; and it is safe to say that the whole stock came from an original tree brought here by some one in the first place. The sterile form suckers freely, and cuttings from it root freely, so that it would soon become disseminated.

The rose acacia is another case in point. It is but two or three years ago since the seed bearing form of this plant appeared, although the sterile variety has been common for years.

Returning to the subject of the paper mulberry, the fruit bearing one is highly ornamental. The tree bears little balls, the size of a small, round plum, and being stuck all over with little red stamens it forms a singular and pleasing ornament when they appear.

Golden-Leaved Privet.

A subscriber in Pennsylvania sends us a twig of golden-leaved privet, thinking it worthy of propagation. So it is, but it is not a sport from his green-leaved one, as he thinks, but the golden-leaved form of the California privet, which is already valued and in cultivation. This green bush is probably a golden-leaved one that has reverted to the green form, which it will do, and the golden shoot is an attempt of this variety to hold its own. This, the golden-leaved one, is prone to get back to its green state, and it needs much attention to start it right by cutting out the green shoots as fast as they appear. After the bush is well fixed as a golden-leaved one, not so much care is needed in after years, but for green shoots to entirely cease to appear is uncommon.

This golden-leaved privet is sometimes seen grown in tubs, and the plants are then not always as nice looking as they might be, because of lack of food.

All privets like rich soil to grow in, in order to make vigorous shoots and large, healthy leaves. A good dressing of manure is a great help to them at all times, especially when in tubs. Summer is the time to increase privets by green wood cuttings. Take half ripened shoots, cutting them into small lengths, and place them in frames or in a greenhouse, and every one should root and by Autumn should be stocky little plants.

Privets, especially the California, are in great demand about Philadelphia. The plants make a nice boundary line between properties and along roads—

Platanus Orientalis, Oriental Plane

better than any other subject would do—are green, bushy, and pleasing to look upon almost the whole year through.

Pruning Beech at Planting.

Planters often speak of the trouble of transplanting beeches, but this trouble ought not to be met with if a good pruning be given at the time. Every one of the beeches require a hard pruning to have them do well, especially those not frequently transplanted. In this respect they are not unlike the oak. Given a close pruning they are safe; without it they are not sure to succeed. The likeness exists, too, in the case of transplanting when young. If this has been done several times before trees are six feet high, but little pruning of the branches is required.

There is one variety of the European beech, the fern-leaved, which is exceedingly hard to transplant. The trouble is that while making innumerable twigs, it makes but few roots. There is nothing else to do but to cut away the greater portion of its branches. Better to greatly lessen its size than lose it.

The European beech is often planted as a shelter tree, its old, dead leaves remaining on the branches until the sap rises in Spring, just as they do on many species of oaks.

Pyrus Japonica as a Hedge Plant.

The San Jose scale has deterred many from planting the *Pyrus japonica* of late years. It does like this bush, but if we are to eliminate every bush the scale attacks from our planting lists, the whole of the pyrus, prunus, and many other families will have to go. This will not do, and it will be better to fight the scale and to look on spraying as a yearly task, just as many other things are. From the numerous experimenters with spraying compounds we shall surely receive in time mixtures to be relied on for all trees and shrubs requiring spraying. The writer has tried on his peach and pear trees kerosene emulsion, lime and sulphur, and, lastly, scalecide, and the last named was the best of all. Used in the proportion of one part scalecide to twenty parts of water, it killed every scale it touched, which the other mixtures did not do. But one spraying was done, in March, before the leaves

appeared. Whether these compounds will hurt trees in time, as some aver they will, remains to be seen. In the case of the trees referred to, the scalecide was applied last March, and the past Summer saw a better growth on the trees than they had ever made before.

When a well known effective destroyer of the scale is assured to every one, the planting of all kinds of trees and shrubs can go on as before.

Platanus Orientalis.

Because of the great call for the oriental plane for street and avenue planting our photograph of it will interest our readers, we are sure.

This is the *Platanus orientalis*; the one of our forests is *P. occidentalis*. Because of its quick growth and of its forming a well shaped tree, as well as for its growing to a tree of grand proportions, the oriental plane has found favor with our landscape gardeners for park plantings and other work where a very large tree can be permitted. Unfortunately the demand for it thus created has led many unthinking persons to use it for planting along streets of narrow width, those of 40 feet wide or so, making one of the greatest of mistakes. The oriental plane, as well as the one of our own country, is the largest of forest trees, and what the result of the planting on narrow streets will be may be imagined. Those who have the selling of trees should explain to their patrons that this tree becomes in time several feet in diameter. In our forests plane trees have been known with trunks 13 feet in diameter or, say, 40 feet in circumference.

Where planted along wide avenues, as for example the one facing Horticultural Hall, Fairmount Park, Philadelphia, no other tree could take its place as well. The beauty of the trees to-day and their utility in the way of shade are well worth a journey to see.

The reason for the use of the oriental plane instead of our native one is that it is comparatively free from a fungus attack to which the native one is subject. Further than this, it makes a loftier tree and a more thrifty looking one. Some difficulty is experienced by those not well acquainted with the two trees in distinguishing them apart, as the foliage, though distinct, is not so decidedly so to the eye of the amateur. When the trees reach the seed bearing age, which they soon do, the two are readily distinguished, the native bearing its balls of seeds singly, while the oriental has them in strings of two nearly all together, a few perhaps with but one and sometimes a few with three balls to a stem.

The one pictured is quite a young tree, but it represents the character of growth very well, and shows what a good shade tree it would make. It is no more than 15 years planted, so what it will be like when 30 years old may be imagined. Yet, as mentioned, this tree is being set out along streets of narrow width in many of our cities. This one is now quite as large as it should be for such streets when it is full grown.

For a single tree on spacious grounds it is a magnificent one, as well as for the wide avenues and parkways, as already mentioned.

Conifers for Forestry Purposes.

The United States Department of Agriculture, which has given much attention to the subject of forestry of late, furnishes in a pamphlet recently issued a list of coniferous trees valuable for the purpose. This is the list: *Pinus Strobus*, *P. resinosa*, *P. rigida*, *P. Banksiana*, *P. sylvestris*, *P. ponderosa*, *P. insignis*, and *P. Coulteri*; among the piceas, the following: *alba*, *rubra*, *pungens* and *excelsa*. To these are added European larch, American Arbor vitae, and balsam fir and Douglas spruce.

It must be remembered that this list covers the whole country, and that the *Pinus insignis* and *P. Coulteri* are unfitted for the North, and that *P. ponderosa* and Douglas spruce must be of the hardy Colorado form for Northern use. It appears unquestioned that there will be a great call in the future for forestry seedlings, and nurserymen may well prepare for it by sowing seeds for the purpose.

This is the season to be looking out for a supply of seeds of the required kind, for, of one of the leading sorts, the white pine, the crop has been short for some years past, as it is again this season, and the seeds of it ripen in August.

JOSEPH MEEHAN.

THE FLORISTS' EXCHANGE

10,000 American Arbor vitae,

(THUYA OCCIDENTALIS.)

Each tree grown wide apart and splendidly developed on all sides. So bushy that for hedges or screens they will go almost twice as far apart as ordinary Arbor vitae will. They have been frequently transplanted and are supplied with an abundance of fine fibrous roots. Can be dug and shipped with ball if desired.

New York.

The Week's News.

With the near approach of the annual convention of the S. A. F. O. H., considerable interest is manifesting itself "in the street" regarding the candidates for the presidency and treasurer-ship of the society; no change in the secretaryship being considered a foregone conclusion. The prevailing opinion here is that Treasurer Beatty will succeed to the presidential chair; and two local candidates, at least—both well known wholesalers—have their eye on the treasurer's office. Both being good financiers, either one of the candidates would prove acceptable, and as each one has a pretty large following a lively contest is likely to ensue—should the minds of the gentlemen in question remain fixed on the subject. We wish both of them success; and may the best man win out—an undeniable fact, which can safely be looked forward to.

There is very little doing in a business way either in the wholesale or retail lines just at present. The Broadway retailers, however, make strenuous efforts to keep their store windows attractive, for which purpose a great many water lilies and Lilium auratum are being used at the present time.

M. Ford of Ford Brothers, wholesale florists at 48 West Twenty-eighth street, is located at Stamford, N. Y., a pleasant town in the Catskill Mountains, where he will spend a three weeks' vacation.

Clarence Saltford of 46 West Twenty-ninth street is enjoying his vacation up the State.

William Plumb has been appointed superintendent at Elm Bank, Wellesley, Mass.

Douglas, youngest son of David Deans, Astoria, L. I., is very ill in the hospital.

The firm name of Dean & Parse, florists at Summit, N. J., has been changed to Parse Brothers, Mr. Dean retiring. Mr. and Mrs. P. Ouwerkerk of Weehawken Heights sailed on Wednesday morning on the steamship Noordam for a visit to Europe.

Visitors in town this week were H. H. Groff, Simcoe, Ont., Canada; John Bader, Allegheny, Pa., and H. L. Blind, Pittsburg, Pa.

CANADIAN NEWS

FREDERICTON, N. B.—J. Bebbington & Son, writing on July 9, say: "June and July so far have been the busiest months on record. All bedding plants have been sold out, except annuals, which have not gone so well. Chrysanthemums are planted, and the carnation benches are being prepared for their contents. Stock outdoors never looked better than this season. The Summer since June 12 has been an ideal one for growth.

"Trade in all lines seems to be prospering. Help is scarce, and wages are going up.

"The July 6 issue of The Florists' Exchange was exceptionally attractive and interesting, especially the matter concerning peonies."

BODDINGTON'S CHRISTMAS SWEET PEAS

BODDINGTON'S EXTRA-EARLY CHRISTMAS WHITE SNOWBIRD. An exceptionally early Sweet Pea for indoor flowering—will bloom six weeks after sowing. Color clear white upon long stems; habit fairly dwarf, and of exceptionally free flowering qualities. Trade pkt. 50c., 1lb. \$1. 1lb. \$1.50, 1lb. \$2.50.
CANARY. Similar to the above, but flowers of an exceptionally good yellow. Trade pkt. 50 cts., 1lb. \$1, 1lb. \$1.50, 1lb. \$2.50.

FLAMINGO. Color scarlet; free-flowering and early. As the crop of this variety was small, we can only send out packets this season for trial. Pkt. 25 cts., 5 packets for \$1.

BODDINGTON'S CHRISTMAS PINK. This is the earliest and most profitable and useful Sweet Pea in cultivation as by sowing the seed under glass in latter part of August, flowers can be cut from Thanksgiving on during the winter months. 1lb. 30 cts., 1lb. 50 cts., 1lb. 75 cts.

BODDINGTON'S CHRISTMAS WHITE. A companion to Christmas Pink. Just as free and profuse a bloomer, and, without doubt, the finest early white for indoor planting. 1lb. 30 cts., 1lb. 50 cts., 1lb. 75 cts.

Our Fall Bulb Catalogue now ready, if you have not already secured one—send a postcard today. Besides a full collection of seeds for fall sowing it contains a list of over

Two Hundred Varieties of Perennial Seeds

that can be sown now.

Timme's Timely Teachings.

Hollyhocks.

A good strain of hollyhocks in full bloom will brighten up a garden as nothing else will. Made to form a screen or background to border and byway, or banked against verdant woods and shrubbery they are truly grand. Rightly placed, a dozen plants or so will make an imposing group on the lawn or about the grounds of the most humble homestead as well as the most pretentious of gardens. No wonder hollyhocks are so much called for every Spring and are among the best selling of the retail grower's bedding stock.

Unfortunately hollyhocks, though easily grown into presentable plants for the annual bedding demand, are subject to a most insidious disease, which attacks the plants after being set out, and is one hard to avert and nearly impossible to cure. This renders their culture somewhat risky to the grower and most disappointing to his customers. The hollyhock disease, when it first appears, is known by a slight shriveling of a leaf here and there. The immediate removal of these infected leaves does not stop the trouble. One leaf after the other will gradually wither away, denuding the plants of every vestige of healthy foliage, leaving a raggedly bare stem with a few imperfectly developed or discolored flowers, but more often the entire plant is destroyed before it has reached the flowering stage. This has been so for quite a number of years, but of late it appeared as if the disease had become less frequent in some localities, batches of flowering plants never having shown a trace of it last year; and in my immediate neighborhood those of my own raising, with

a loss of but one or at most two in a dozen, came through in finest shape and with perfect health up to the close of their season. No complaints were made by any one of my customers, as had been frequently the case in former years. All of this season's plants, raised on my place, as far as I was enabled to watch their behavior, as well as those on nearby places, give promise of doing equally as well as those sold last season. This has led me to regard—and to discuss—the culture of hollyhocks with that degree of confidence in possible success which is necessary to make well-directed effort worth while.

Hollyhocks are easily propagated by rooting cuttings, taken in July and August from the finest of plants. Superfluous shoots, anyway to be cut away on finely branched plants, are used for the purpose, or those coming from the crown of the roots. They are stuck into small pots, any good, sandy soil being all right, are kept moist and shaded and may remain in the frame till late in the Fall or all Winter under proper protection if so desired. Thus, after a repotting in early Spring, a very choice grade of stock, dwarf and stocky, is obtained, superior in many respects to seedlings. The grafting of hollyhocks, the finest kinds on to strong growing seedlings, cleft grafting in the usual way into the crown of the roots, kept close until firmly connected, as practiced in years gone by, is an operation nearly always entirely successful but of doubtful value nowadays.

The more common way of raising a goodly supply of marketable plants for next Spring is from seeds. The sowing should be done in a frame or well prepared open border, but the bed should be covered or heavily shaded until the seedlings are strong enough to stand clear sunshine and an occasional dry spell of weather. A better promising lot of plants will be had for next Spring by sowing the seeds now—in July—than in May, as I have proved to my own satisfaction in the last two seasons. If sown thinly in drills the plants may be left undisturbed until next Spring with the sashes over them and some additional covering during the coldest period; if not, a transplanting with an allowance of more room is necessary before Winter sets in, a potting up into small pots being the better way. At this first transplanting it is well to clip off a piece of the tap root, which results in a densely fibered ball of roots and wards off much of the mischief alluded to. The potted plants can be wintered either in a frame under adequate protection, or in any cool but frost-proof place in or about the greenhouses. Nicely started 4-inch stock is the best for a local home trade.

The new strain of annual hollyhocks, flowering the first year from seeds sown early, is claimed to be entirely free of disease. I am trying them this season. The plants so far look well, are healthy and of a remarkably fast growth. We are told that last year some seeds of this new kind were sown in the open ground on the 19th of May and that the plants resulting therefrom came into bloom at the close of August, continuing until frost. A profitable kind for florists, indeed, should it prove fine all through.

Mignonette in Pots.

When the thoughts of greenhouse men turn to mignonette as a possible good thing for indoor culture they only weigh in their minds its value as a yielder of cut blooms, not aware of or ignoring the fact that mignonette constitutes excellent stock when grown for the pot plant trade. In considering violets, snapdragons, carnations, and a few other kinds of greenhouse subjects it is the same, and even the retail grower thinks of them only as ventures in the cut flower line. And yet, potted plants of all these cost less to grow and give greater assurance of adequate returns. No harm to the cut flower industry would come from turning a goodly portion of this kind of stock into other channels of trade. I have for years grown potted plants of all the above noted sorts and never yet came to the close of a season with any left over or not fully convinced that I could have sold more had they been available; and that at prices satisfying to me, willingly paid by my customers and not subject to shrinkage from the pressure of an all-around competition.

Mignonette is much prized as a house and window plant and sells well at nearly all times. To have it in good form in early Winter it is necessary to sow the seeds now, and successive sowings at intervals of six or eight weeks will keep up a ready supply until away into Spring. Stately one-stemmed specimen plants or nicely rounded dwarf bushes, all are good and find admirers, and the strain of seed used as well as after treatment here plays a telling part. My favorite variety for pot culture and, I think, the most easily managed of the various kinds offered is the large flowered pyramidal, but Machel and even the old common mignonette, still the sweetest of all, make good appearing plants in pots.

Fill 3½ or 4-inch pots to within an inch from the top with good potting compost; sow eight or ten seeds on this, press all of it down firmly, using an empty pot for the purpose; set the pots on ashes in a frame, water thoroughly but carefully, close the frame and cover with boards, giving air once a day. When the plants are coming up, the boards are removed, a light shading being used instead, and air is now freely admitted. Let the plants attain some appreciable size then thin out, leaving the strongest one or three or four of the best, according to the kind of stock it is intended to raise. Several seedlings together will grow into nice, compact bushes and require the least amount of care and training. After the thinning out another half inch or so of good soil is filled in about the remaining plants which will afford a sustaining basis for sturdy, upright growth, and instead of causing them to damp off, as might be supposed, will avert that trouble.

Plants intended to be grown into bush form will be all the better for a pinching back when about four inches high. When the first pots are reasonably well filled with roots it is time to give them the second and final size of pots, the 5 and 6-inch being the best market sizes. Now use the richest kind of composted soil, plant very firmly, afford air and sunshine, trim and tie up if needful, use judgment in watering and begin feeding with liquid manure when the flowers develop.

Perennials.

The seeds of several kinds of herbaceous perennials are best sown in July and August. Started in frames and there left until Spring, or potted up in the Fall and given room in a cool greenhouse for the Winter the plants will be good stock for being set out into permanent borders or for the regular plant trade in the Spring.

Those that were started from seeds last year will now be in bloom, or soon ready to bloom, a few kinds being already past their flowering season. Exceptionally good plants should be marked so as to be sure of them for future propagation by division or cuttings. In raising seedlings of perennials the grower should confine his efforts to such kinds as can only so be raised to advantage if the object is merely to obtain a good supply for his trade. To fill limited garden space with a mass of worthless seedlings with a few fairly good ones among them, to painstakingly spend years in working up a stock of

in DECORATIVE PLANTS
Market and 49th Sts. PHILADELPHIA, PA.

some consequence, not better or perhaps not as good as what could have been procured at the start in any quantity, seems exceedingly unwise. Highly improved varieties of most of the leading perennials are offered right along, and a grower who wants the stock for his own use as a permanent outdoor crop will do better in making a start with these than with a package of seeds.

The list of hardy perennials is a long one, embracing some gems of the garden and some good things for florists to handle, but also a great number of things absolutely worthless. Good judgment, therefore, is needful in determining what to grow. Anyone not fully acquainted with plants of this kind should miss no opportunity in becoming familiar with the various species and varieties. It is an interesting study.

FRED. W. TIMME.

A RECORD BREAKER

GODFREY ASCHMANN of Philadelphia, the
Well-known Araucaria Specialist of America

Watch Us Grow

1907 is now the twelfth year of our anniversary in a successful career in the importation, growing and shipping of that well-known and much admired evergreen decorative plant, the Araucaria Excelsa, Compacta, Robusta and the Glaucous. Beginning with the first year (1895) with an importation of 100, this year (Spring 1907) our importation has swollen up to the enormous quantity of 6,000 in the well-known, three best varieties, the Araucaria Excelsa, Compacta, Robusta and the Glaucous. Our Araucarias are so well introduced that at the present time they represent every city, county and state of America, so far as Cuba and Mexico, and from the Atlantic to the Pacific Ocean. It is always my earnest desire to improve my system in buying, raising, selling and shipping our production to such an extent, that it not only benefits ourselves, but so that it will yield a fair profit into the pockets of our buyers. Now is your chance and the time to fill your empty houses and make money fast, as the plants will grow into money while you sleep.

ARAUCARIA Excelsa, 5 in. pots, 10-12 in. high, 3 tiers, 2 years old, 50c. each; larger sizes, 5-5½ and 6 in. pots, 2-3 4 years old, 60c.-76c.-\$1.00 to \$1.26 each.

Cash with order please.

ARAUCARIA Compacta Robusta, 6 in. pots, 2-3 4 years old, 10-12-16 to 18 inches high, 3 to 4 tiers, \$1.00-\$1.26-\$1.50-\$1.75 to \$2.00 each.

ARAUCARIA Glaucous, 3-4-5 tiers, 2-3-4 years old, 10-12-16-18 to 20 in. high, 6 in. pots, \$1.00-\$1.26-\$1.50-\$1.75 to \$2.00 each. Specimen plants, Compacta Robusta, of last year, Spring, 1906 importation, 6 years old, 30 in. high, 7 in. pots, (something fine), 5 tiers (perfect), \$2.50 to \$3.00 each.

SPECIMEN Glaucous, 6 perfect tiers, 36, to 40 in. high, 7-8 in. pots as broad as long, \$4.00 each (worth \$10.00).

KENTIA Forsteriana and Belmoreana, European stock, 6 in. pots, 25 to 30 in. high, five leaves, \$1.00 to \$1.26 each; 4 in. pots, 18 to 20 in. high, 36c. each.

COCOS Weddelliana, 3 in. pots, 10-12-16 in. high, 15c.-18c. to 20c. each.

ARECA Lutescens, 4 in. pots made up, three plants in a pot, 20c. per pot.

FERNs, Boston, 3 in., 15c.

FERNs, Whitmani, 4 in., 25c.

JERUSALEM CHERRIES or SOLANUM, large berried variety, 2½ in. pots, \$5.00 per 100.

All goods must travel at purchaser's risk.

GODFREY ASCHMANN

Importer, Wholesale Grower and Shipper of Pot Plants
1012 West Ontario St., Philadelphia, Pa.

BOXWOOD

Bushes per pair, 50c., 75c., \$1.00, \$1.25 and \$1.50.

ENGLISH IVY. \$2.00 per doz. \$15.00

per 100.

ANTHERICUM, variegated, for

vases, \$1.50 per doz.

BEGONIA REX, 4 in. pots, \$2.00 per

doz.

ASPIDISTRAS, green, 6 in. pots,

\$18.00 per doz.; 6½ in. pots, \$24.00

per doz. 18 to 24 leaves.

LIVISTONA SINENSIS—8 in. pots,

\$2.00 and \$2.50 each.

DRACAENA FRAGRANS—6 in. pots,

\$9.00 per doz.; larger plants, \$12.00

per doz.

DRACAENA LINDENI, 6 in. pots,

\$15.00 per doz.

DRACAENA MASSANGIANA, 6 in.

pots, \$15.00 per doz.

ASPARAGUS DEFLEXUS NANUS,

new, very fine, 3½ in. pots, \$2.00

per doz.

ASPARAGUS PLUMOSUS, 4½ in.

pots, \$2.50 per doz. 3½ in. pots,

\$1.50 per doz., \$12.00 per 100.

KENTIAS, 50c., \$1.50, \$2.50, \$3.00,

\$3.50 and \$5.00 each.

LIVISTONA ROTUNDIFOLIA in 4

in. pots at \$5.00 a doz.

ARAUCARIA PLUMOSA, new 6 in.

pots, 1 ft. high, \$12.00 per doz.

50c. for packing and boxes for every \$10.00 worth of goods ordered.

ANTON SCHULTHEIS

ARAUCARIA EXCELSA, \$2.00 to

\$3.00 each, 8 and 9 in. pots; 4½

5 in. pots, \$6.00 and \$9.00 per doz.

COCOS WEDDELIANA, 3½ in. pots,

\$2.00 per doz., \$15.00 per 100 and

50c. to \$1.00 each.

CIBOTIUM SCHIEDEI, 8 in. pots,

\$24.00 per doz.

GARDENIAS, in 7 in. pots, large

bushy plants, \$9.00 and \$12.00 per

doz.

RHAPIS HUMILIS, fine bushy plants

in 6½, 7, 8 and 9 in. pots, \$1.50 to

\$5.00 each.

PHOENIX CANARIENSIS, 2 ft. 6 in.

10 leaves, \$3.00 per pair; 2 ft. 10

in., \$4.00 per pair; 3 ft., \$5.00 per

pair; 4 ft. 4 in., \$6.00 per pair.

BAY TREES, Standard, 4 ft. 8 in.

stem, \$12.00, \$15.00, \$16.00, \$18.00

and \$20.00 per pair.

Pyramida, \$16.00 a pair.

NEPHEROLEPIS WHITMANI, 7 in.

pots, \$18.00 per doz.

FERNs, BOSTON, 6 in. pots, \$6.00

per doz. PIERSONI, 6 in. pots,

\$6.00 per doz. SCOTTII, 5½ in.

pots, \$5.00 per doz.

PANDANUS UTILIS, 6½ in. pots,

\$12.00 per doz.

Prices Advertised in these Columns are for THE TRADE ONLY—When Writing Please Mention THE FLORISTS' EXCHANGE.

FOUNDED IN 1888

Weekly Medium of Interchange for Florists, Nurserymen
Seedsman and the Trade in General

Exclusively a Trade Paper.

Entered at New York Post Office as Second Class Matter

Published every Saturday by the A. T. De La Mare Ptg. and Pub. Co., Ltd., Proprietors, 2, 4, 6 and 8 Duane Street, New York. A. T. De La Mare, president; Jas. H. Griffith, secretary; David Tonzeau, treasurer; Alex. Wallace, editor. The address of the officers is the address of this paper.

P. O. Box 1697. Telephone 3765-6 Beekman.
CHICAGO OFFICE: 127 East Berwyn Avenue.

ILLUSTRATIONS.

Electrotypes of the illustrations used in this paper can usually be supplied by the publishers. Price on application.

YEARLY SUBSCRIPTIONS.

United States and Mexico, \$1.00. Canada, \$2.00. Foreign countries in postal union, \$2.50. Payable in advance. Remit by express Money Order, Draft on New York, Post Office Money Order or Registered Letter.

The address label indicates the date when subscription expires and is our only receipt therefor.

REGISTERED CABLE ADDRESS:
Florex, New York.

ADVERTISING RATES.

One-half inch, 75c.; 3-4-inch, \$1.00; 1-inch, \$1.25, special positions extra. Send for Rate Card showing discount of 10c., 15c., 25c., or 35c., per inch on continuous advertising. For rates on Wants, etc., see column for Classified Advertisements.

Copy must reach this office by 12 noon Wednesday to secure insertion in issue of following Saturday.

Orders from unknown parties must be accompanied with cash or satisfactory references.

New Postal Card Rule.

For years Americans and others have been sending to the United States from foreign countries postal cards and post cards—private mailing cards—with messages written on the front as well as back, although in this country this advantage has been denied the users of government postal cards. The United States postal laws and regulations were amended some months ago so as to give that privilege to buyers of post cards, but such concession was not made applicable to postal cards.

Postmaster-General Meyer has promulgated an order, effective on August 1, 1907, providing that the face side of a postal card may be divided by a vertical line placed approximately one-third of the distance from the left end of the card, the space to the left of the line to be used for a message, etc., the portion to the right to be used for the address only. This should allow the trade to use the entire back of the postal card for a picture, if desired, the front being occupied by the firm name and the address of the recipient of the card.

COLORING PHOTOGRAPHY.—Mr. H. H. Groff, of Simcoe, Ontario, the celebrated gladiolus hybridist, was in New York this week and brought with him a developed negative on glass in colors, of some four spikes of gladiolus, two of which showed white flowers with red centers, one red flowers, and one a yellow flower with red center. The colors throughout are very perfect, with the exception, possibly, of the yellow, which may be accounted for by the fact that the bloom was sideways to the lens. The green tints are very perfect, indeed, showing not less than four distinct shades of that color; in the reds the plate shows two shades and the yellow two.

The photograph, by a friend of Mr. Groff's, an amateur, and not a professional, was taken under somewhat disadvantageous conditions. The results demonstrate the fact, however, that we are coming very close to the time when it will be possible for a florist, or anyone else for that matter, to have the subject desired taken in life-like color. As soon as this process is perfected, without doubt, the discovery of how to place these results on paper will follow.

The Gardener as a Tradesman.

The history of horticulture in America, especially in its earlier periods, discloses the fact that many indeed the majority of those engaged in the commercial side of the art were recruited from the ranks of the private gardener. And that most of them were pre-eminently successful in their ventures, the large establishments that they founded, many of which are in operation to-day, fully testify. There is prevalent among some, however, the belief that the "business instinct," so necessary to success in any calling, is not developed in the private gardener to the extent necessary to make a commercial floricultural undertaking a "go," and that this drawback is responsible for some of the failures of those who have changed from private to commercial gardening in modern times. Much of this lack, no doubt, comes from the training the private man has received—a training that is different, in many respects, from that of the commercial man, so far as accounting relative to the cost of production and other matters of that kind are concerned; and the irresponsibility of the gardener for any loss ensuing in the growing of any particular crop. In other words, the employer foots the bills in the case of the private gardener, while the commercial man must depend upon his own resources; the dollars' and cents' end of cultivation is what concerns him most, and his plans are made accordingly.

The advantage, then, of some experience in a commercial establishment by those of the private gardeners who contemplate entering at some time or other the ranks of the commercial grower, at once becomes obvious, so as to better equip themselves for their future work and means of livelihood. With this experience acquired, the private gardener, competent as a plant cultivator, has, other things being equal, as good a chance to succeed in the commercial branch as any others who may enter it; in fact, a much better chance than some.

That the supposed unfitness of the private gardener as a commercial plant operator is not confined to the United States, is evident from an editorial appearing in our esteemed London (Eng.) contemporary the Journal of Horticulture, in which occurs the subjoined remarks, containing helpful and pertinent advice; and to which we invite the attention of those interested:

"It is an unfortunate circumstance, but an undeniable fact, that a large proportion of the gardeners who commence business late in life, either as nurserymen, florists, seedsman, or market growers, fail to make their undertakings successful. Though sometimes due to insufficient capital or unavoidable misfortunes yet much more frequently the failures are occasioned by a lack of commercial knowledge or business aptitude. The great lesson has not been thoroughly learnt of how to make a moderate expenditure yield a margin of profit in the resulting produce. It is a hard lesson to master, and must be attacked early in life, patiently following the study of economising outlay without decreasing efficiency throughout all the available departments of horticulture. Yet its importance at the present time is great, and there are many indications that it will rank even higher in the future, therefore it would be wise on the part of all young men to include attention to the commercial side of horticulture amongst the essentials of their training. It is not only in nurseries that these are to be gained, though much useful knowledge can be acquired in such establishments, but a period of work in some of the great market gardens is of the greatest value. It is not a pleasant ordeal to go through, for a man has not only to prove his smartness and ability, but he is required to give a substantial return for his wages. He will probably have to deal with a keen foreman or manager who will exact his full 'pound of flesh' for the benefit of the owner, and he will, perhaps for the first time, begin to comprehend what hard work really is. But at the end of the trial he will, if observant and industrious, be in a better position to understand the means by which commercial gardening can be rendered profitable. Beyond this he will find in after life that many more chances are open to him as a cultivator either in the service of others or in business for himself.

"Even in ordinary gardens useful practice can be had in connection with the business aspect of horticulture by keeping a record of the outlay in the production of special crops. Every item should be entered on the expenditure side, and if the produce is not actually sold a careful estimate should be made of the market value, not bare or retail prices, and if the balance is against the grower, review the whole process, and determine where reduction could be effected without diminishing the amount or value of the crop. Such a method as this pursued through several years cannot fail to afford some interesting and useful knowledge which might be turned to good purpose. More economical methods will be found, and the productive power of moderate means correspondingly increased. A man possessing experience of that kind will rarely be in want of a post, and if he launches out in business for himself he is in some degree prepared for the competition of the age."

OUR READERS' VIEWS

A Correction.

Editor Florists' Exchange:

We wish to correct a little news item that appeared in your issue of June 29, regarding our company which is quite misleading. There has been no change whatever in the management or control of the Southern Floral Nursery Company, neither has there been any change in their plans. The largest of our nurseries are located at Buckatunna, Miss., where J. E. Bridge, president of the company, resides, and where the company is incorporated under the state laws of Mississippi. Our general manager's office is located at Fruitdale, Ala., and our correspondence and mail order work is conducted from that point. As both are under one management there is no cause for a merger, as the item referred to tells of, and although some of the people of Fruitdale think we ought to move the entire business to this place, we know our own business and can conduct it along the broad gauge lines already laid down.

Instead of narrowing it down to one location, we are expecting in a few months to establish another large nursery in an adjoining city for the purpose of further extending our rapidly growing business.

SOUTHERN FLORAL NURSERY COMPANY,
L. H. Read.

Sweet Peas.

Editor Florists' Exchange:

Replying to the communication of Ant. C. Zvolanek in your last issue, the only part of the tirade that is worthy of consideration is where he states that I acknowledged that the peas he sent me were the same as my lavender sport. This is incorrect, and should he think it a benefit in lessening the accusation he has my permission to mail my original letter to the Editor of The Florists' Exchange for publication. The Editor can ascertain by comparison whether it is my original handwriting or not. I, however, fear Mr. Zvolanek may have mislaid the letter.

In conclusion, Mr. Zvolanek, why have you dropped the vetch theory? Why don't you explain the article in Moller's Deutsche Gärtner-Zeitung? Why does it take you three or four years to establish a variety while my sports do not vary in color, that I can see, after the first year? Why do you say that you re-select your pink and white seed under glass when you do not? Why did you say you examined what I claimed were sports and found they were chance seedlings, when I had burned the original vines one to two years before you had been here?

Mr. Zvolanek had these same questions before him in my communication on page 741, June 1, 1907, issue of The Florists' Exchange and failed to answer them; therefore, why waste ink?

Ronks, Pa.

CHARLES M. WEAVER.

The New Opuntias.

Editor Florists' Exchange:

On the first page of Part One of Burbank's catalogue, "The New Agricultural-Horticultural Opuntias," issued June 1, 1907, the following statement appears: "But among the cacti which grow to an immense size with great rapidity, and which can be readily cultivated in garden, field or desert, no perfectly thornless ones were known, and very little interest taken in the cacti of any kind, either thorny or thornless, as to their agricultural, or horticultural value, until the work of improvement was taken up on my experiment farms, and improved, perfectly thornless, rapid-growing varieties had been produced and made known within the past few years."

Without any desire whatever on my part to depreciate the work that Mr. Burbank is doing in the horticultural world, or to provoke a controversy regarding its merits, the fact remains that for fifteen years a "perfectly thornless opuntia," of large size, has been growing in Elysian Park of this city. The "slabs" are as smooth as a kid glove, and as the plant encroached on the walk leading to the greenhouse door, the employees about the place chopped the slabs off and threw them on the rubbish heap. The size and quality of the fruit of this plant will be noted and referred to again when matured.

As to the quality of the "fat young leaves" of this plant as a "wholesome food" when fried like eggplant, the writer will determine at an early date. The quality of the fruit of one plant of opuntia the writer knows of is most excellent, having the flavor of the Black Tartarian cherry and of the strawberry combined, and is about the size of a hen's egg, with a claret-colored juice. This fruit has minute spines,

invisible to the naked eye, but terrible to the touch. Because of its growing in a land where almost all the fruits of the temperate zone and some varieties from the tropics grow to perfection, the excellent opuntia fruit in question has not received any attention. The fruit of some of this family of cactus is utterly unfit for human food.

There can be no doubt as to the value of these plants for the arid regions, both for food and forage; but they, like all other crops of a defenceless character, must be protected from animal life that feed upon them to prevent extermination.

Los Angeles, Cal. P. D. BARNHART.

Gladiolus America.

Editor Florists' Exchange:

My references to this one of the many useful varieties sent out by me during the past fifteen years, have been simply for the purpose of arriving at certain truths regarding it and the flower in general. It was not my expectation to involve myself and others in a bitter, personal and irrelevant controversy, where petty grievances and disagreements were to be publicly aired, to the distaste of disinterested readers.

Were the other disputants sincere in their desire to account for the presence of America in my stock for many years, this knowledge could have been secured without the absurd and lengthy controversy, containing so little fact, that has been inflicted upon your readers.

Mr Childs' wonder that my customers were not greatly impressed by the appearance of this variety in the stocks supplied by me, is simply due to our diverse view points. My customers are and have been accustomed to receive high class varieties in my collections.

Mr. Childs stated that Mr. Banning did not claim to have originated America. The same week, in another publication, Mr. Banning said that he had. Surely this is disagreement.

The cormels of the species *Saundersoni* are not compacted like those of America. This fact, however, would be no evidence of the absence of *Saundersoni* blood, were it otherwise apparent, as a cross between two sections affects the progeny diversely, and on distinct points, others not being visibly affected.

The remarkable statement by Mr. Childs that early planting insures maturing of the cormel, is proof of the prevailing inconsistency of his arguments. The end of the season, not the beginning, is the maturing period. This with me is too frequently abbreviated. Even those corms that have remained in the ground all Winter without injury do not mature their cormels fully, unless the end of the season is favorable. As these conditions in some types prevail even in the south of France, it is small wonder that they affect us in this latitude. This is an aspect of my interests to which I am giving some careful scrutiny, with the view of preparing an article on the subject at some future time.

Mr. Christy cauterized me in a recent issue of one of your Chicago contemporaries, for designating him as "Mr. Banning's grower." If that position is distasteful to him I beg to apologize. Mr. Banning circulated a leaflet, illustrated by an electro of "my grower Mr. Christy." The error therefore did not originate with me.

H. H. GROFF.

Peonies.

Editor Florists' Exchange:

Quite a few specialists seemingly are off in claiming Floral Treasure and Delicatissima as synonyms; I would like to know whence their stocks and the authority for their claims? Floral Treasure, from Rosenfeld, we accept as final, owing to his being the introducer; in all our purchases we only have this from one other source, "LLL pink" from Peterson being identical. Delicatissima, as we have it from a grower of note, it having been in his hands for fully 20 years, is very much like Nec Plus Ultra, a more perfect, larger, lighter, more vigorous grower, the finest of this class, in no way like Floral Treasure, which is evidently a descendant from Mme. Calot. Delicatissima as far as I can trace its wanderlust, is a variety of Holland extraction.

Golden Harvest and Jeanne d'Arc are in some ways quite similar, in others quite dissimilar. Jeanne d'Arc is somewhat larger, more robust, but not so hardy, less prolific; if anything just a shade lighter, too.

I think an honest grower is just as competent to pass judgment on new sorts as any other person or persons. I object very decidedly to a grower having a list of a few dozen sorts, grinding out seedlings at wholesale that are practically not superior or even equal to many existing sorts; if these fellows

had such a voluminous list as we have, they would readily eliminate many as merely reproductions, nothing else. When we see such experts as the Massachusetts Horticultural Society giving certificates to Mrs. Gwen Lewis (Duchesse de Nemours, Calot), M. Chas. Levique (a renamed sort), what can we expect of the less informed provincial fellows? Do not some of these professors, doctors of horticulture, need a little more enlightenment on peonies before they pass favors with the liberality of politicians?

When I received a copy of the much lauded peony check list I hoped that I had a prize, but, alas, I found to my regret and sorrow a very poorly edited mass of very incomplete peony nomenclature; it needs completion. Further the American Peony Society can make up a list of 75 to 125 sorts that will include all of the very finest things grown to-day. Our own large stock was more than perfection this year, so we can speak advisedly, understandingly and exactly from our own experience. With about 1,000 sorts in bloom during the season, one ought to be able to know pretty well.

There are far too many American seedlings following in the path of the Europeans of long ago, too many duplications and inferior ones. We have paid \$1 to \$3 each for microscopical specimens that are hardly as good as older but better sorts of the same colors, etc., yet they come with "certificated" endorsements; how is that for gold bricks? Practically, from only one firm have we got a bad mess. One noted firm, of whom we got about 100 sorts, sent us Andre Lauris under six or more names, in novelties costing us about \$1.75 to \$2 each; not fifteen of the lot are new, truly labeled, or answer descriptions, nearly every one being an older sort renamed.

We will not make much progress in clarification of nomenclature if we have a continual change in the men in charge; peonies must be seen to be correctly classified etc., and only the best informed should undertake this task. With such a grand subject for making for progress, we should begin to educate the masses to its grand qualities and let the nomenclature end of it be clarified as we go along. We have 50 to 150 very fine sorts that we can agree to, at least 50 that are grown in liberal lots that we are practically agreed upon; why not make for a greater interest now, not an age ahead?

I may add right here that dahlias, cannas and many other subjects are in about as bad a mess with many growers as peonies. As an instance, Black Beauty, unquestionably the finest of all cannas, not one plant in ten sold is true; many firms are selling Robusta for it, and many others are selling a sort called Marechal Valliant for it. In most cases the sellers are innocent, having bought from those they considered experts; others are so greedy and unscrupulous that they do not care, nor will they make good simply reminding one that the courts are for such matters. But does it pay to spend \$25 on a \$25 account?

C. BETSCHER.

Canal Dover, O.

Reflections on Current Topics.

MR. EDITOR: When I penned the few lines comment upon the Canadian journal's effort to keep its columns clear of "flapdoodle," I had no idea that my remarks would be provocative of the acrimonious discussion that has followed; neither was I aware, although I consider myself pretty well posted on things in general in a trade journal way, that your Canadian contemporary was only aping in this one particular, your progressive Boston co-worker in the field, until the announcement "I done it first," appeared in the columns of the latter luminary. However, as I believe in credit being given (or taken) where it rightly belongs, I am pleased that the gardening world has now been put right on that matter, for the adoption of the system in question is one of which any editor, young or old, should be proud. Withal, I cannot quite see that the Boston man is consistent when such buncombe as McGorum's last effusion and Watson's account of John Birnie's visit to the Quaker City are permitted to appear in the same high-grade periodical along with the "Life of Linnaeus," and other quasi-scientific contributions. The Boston editor appears to be one of those reformers who do not reform. His intentions are, no doubt, good, but he evidently lacks the backbone to carry them out in full. This shows that he is only natural after all, and not the rara avis among us he would fain have it believed he is.

Adverting to scientific contributions, I was somewhat amused on reading Robert Cameron's comments on the rearing of monuments to Linnaeus and Colum-

bus in our public parks and other places, as set forth in the ultra-intellectual periodical referred to. Mr. Cameron says Linnaeus "made the world a better place to live in," and calls Columbus a "great naturalist." To my way of thinking neither of these statements is correct, the one regarding Linnaeus, being evidently the outcome of a hero-worship of one scientist by another, if I may be permitted to class Mr. Cameron as such. There are many men who have done more for mankind than Linnaeus ever did, who are still without a monument, although the talented Swede has his quota—and rightly so, perhaps; and there are hundreds and thousands who do not know, or care, that he ever lived, simply because the work he accomplished does not and cannot concern them on account of its limitations to one phase of science only. As to Columbus being a "great naturalist," probably Mr. Cameron's characterization has been deduced from the pictures, which I myself have seen, of the explorer surrounded with a few Indians and their squaws, some of whom carried a monkey and parrot. However, that is no reason why monuments should not be reared to Columbus. I hope some day to see one erected to Mr. Cameron, who, according to himself, has, like Columbus, plowed the "briny deep," and made explorations on his own account. In fact as the years roll on, I would not be surprised if New York, or New Jersey rather, erected a monument to John Birnie, who having made two geraniums grow where only one grew before, is a public benefactor—if he didn't "make the world better to live in"—and is therefore as much entitled to a statue in Central Park as his rhyming, "rantin', rovin'" countryman—Robbie Burns.

Some time ago, I read of Robert McGorum having received his quota of government seeds, which he says, he fed to his hens, and he then proceeded to criticize the Congressmen and all who support them in the free seed distribution. Since then I have been wondering why the "Sage of Natick" wasn't man enough to refuse or return the unclean "graft" to the sender. But the thought has just occurred to me that it's like pulling teeth to get a Scotsman to part with something that costs him nothing. I notice, too, that Mac is in the habit of getting catalogues of periodicals, and that in one of these your paper is, he says, listed with the Cat Journal and the Foolish Book. That the bookseller distributing that catalogue knew his man, and the literature that best suited him, is the humble opinion of

JOE.

SWEET PEA COUNTESS SPENCER.—This variety seems to be producing more surprises this season in the shape of progeny with new colors. The variety Countess Spencer resulted from a cross effected between Prima Donna and an unfixed seedling in 1899. The raiser was Silas Cole, Althorp Park gardens, and seeds were put in commerce before the variety was fixed. This, and the fact that some seeds of another variety were accidentally mixed with it, would account for the appearance of so-called sports. There can be no doubt that these sports are the result of cross-fertilization, and until recently I imagined that they must all be the result of Mr. Cole's crosses, but I am now of the opinion that, owing to this flower possessing an open keel and protruding stigma, cross-pollination may be effected by other than human agency. The Countess Spencer type of flower is not so readily self-fertilized, consequently is the more easily cross-fertilized than the older type of flower.—The Gardeners' Chronicle.

Charles Wesley Price.

Charles Wesley Price, late traveler for the Alberta Nursery & Seed Co., of Calgary, died very suddenly recently at Calgary, Can., the immediate cause of his death being heart failure. Mr. Price had been a traveler for thirty-five years and had covered in that time nearly every state in the United States and every province in Canada. In the older provinces he was better known as the representative of D. M. Ferry & Company, of Detroit and Windsor, whom he represented for fifteen years. After leaving them he was for a few years with the Steele, Briggs Seed Company of Toronto. After leaving their employ he went West and settled in Calgary.

He was a faithful, industrious and successful traveler, and possessed in a large degree the faculty of winning and keeping friends, and many all over Canada and the United States will mourn his demise.

Rose Show of Newport (R. I.) Horticultural Society.

The rose show of the Newport Horticultural Society was held in Masonic Hall on Tuesday and Wednesday, July 9 and 10, and was a most decided success. The competition in the large classes for roses was in a way keen, but the superiority of the blooms as well as the larger number of varieties of two exhibitors, who were winners in the two most important classes for roses, detracted somewhat from the interest that would have been taken had the contests been more even. Roses, both as to quality and size of the display as a whole, exceeded exhibits of former years, and this in spite of a postponement of the date of the show made necessary by weather conditions.

Class 19 called for collections of outdoor roses for prizes offered by S. G. Harris, Tarrytown, N. Y. Three lots were entered from Mrs. T. O. Richardson, Alfred Vanderbilt and William Waldorf Astor; James Robertson, Alex. Adam and Hugh Williamson, gardeners, respectively. James Robertson was awarded first prize for a superb collection of nearly seventy varieties, every bloom being perfect or very nearly so. Hugh Williamson was second with a fairly good collection, but his blooms were much smaller than those of Mr. Robertson, and stems much shorter. Mr. Williamson also lacked the advantage of such roses as Frau Karl Druschki, which formed a strikingly prominent feature of the first prize exhibit. Alexander Adam took third prize in this class with a fairly good collection, which lacked size in individual flowers with the added drawback of many flowers being too far gone at the time of staging.

In the class for a display of outdoor roses to be arranged for effect there were only two entries staged. Colin Robertson, gardener for Mrs. Robert Goellet, was the winner with a splendid lot of blooms; John Marshall was second. James Robertson took the greater number of first prizes in the other classes for roses with his brother Colin following him up a close second.

In the rose display, among the most notable sorts was that unapproachable white Frau Karl Druschki; it helped the winner of the Harris prize and it helped still the same winner to secure first in the class for a vase of white. Rose growers for exhibition and growers for all other purposes cannot afford to be without this rose, neither can they get along without many other good varieties of recent introduction. Although for a large pink rose Mme. Gabriel Luizet showed up well at this show, Mrs. John Laing followed closely and proved a better rose for decorative purposes because of a better form and better foliage.

Indoor roses were very poorly represented, and American Beauty not at all; this because of the market demand and the scarcity of the local supply available in private greenhouses.

Made-up baskets were fairly well staged. F. L. Zeigler took first for a fancy basket of General Jacqueminot; John Marshall, second.

In the class for assistants Agnus Allan, employed by Gibson Brothers, was first; Harry G. Christian, second, and William Fricker, third. Among the special exhibits of roses were two vases of new varieties shown by Paul Volquhardson, one, Gruss an Zabern, a small white rose for which he was awarded a bronze medal, and Trier, also a white of the same character for which a certificate was awarded. Mr. Volquhardson also exhibited a large vase of immense blooms of Frau Karl Druschki.

Collection of Roses Exhibited for the Harris Prize by James Robertson at Newport Show

Stewart Ritchie staged some good sweet peas and carnations, and John Marshall, carnations and Dianthus barbatus of exceptional development.

All, or nearly all, the exhibits of plants were interesting from one point of view or another. For groups of palms, ferns and foliage plants there were only two entries; Colin Robertson was easily first with an effective group composed in great part of *Areca lutescens*, large specimen crotons of fine color, and dracenas. Mr. Boyd, who was second, made up his group mostly of kentias and other foliage plants of too sombre hue to compete with material such as the other group was composed of. In the class for palms, ferns and flowering plants, the same two exhibitors competed with like results because of like conditions. Mr. Robertson had color and effectiveness in his anthuriums and gloxinias; Mr. Boyd had not much of either in his flowering material which consisted of lilies exclusively with the exception of a finish of begonias.

The class that excited the greatest interest, the keenest competition, and which brought out the largest number of exhibits was Class B, which called for a table of decorative foliage plants. There were four exhibits staged by the following: John Marshall, Charles D. Stark, James Boyd, and David McIntosh. Mr. McIntosh took first, John Marshall, second, and James Boyd, third. The class for six dracenas was also keenly contested by three exhibitors: David McIntosh took first, C. D. Stark, second, and James Boyd, third. The same exhibitors in the same order won the prizes offered by Henry A. Dreer for three decorative foliage plants in 6-inch pots; in this class David McIntosh showed specimens of *Dracena* Lord Wolseley, *Croton* faciatus, and *Pandanus* Sanderi. Charles D. Stark showed *Phoenix* Roebeleni, *Kentia* Belmoreana and *Dracena* Massangeana.

Fruit was not largely shown, but nectarines were fairly large and of good color. James Robertson was

first and John Marshall second for nectarines. David McIntosh was the only exhibitor in the class for grapes and showed a bunch of Black Hamburg. James McLeish made a special exhibit of grapes and nectarines. His grapes were Lady Hastings and Diamond Jubilee. The latter was shown here a few years ago, but since then little has been heard of it, and the wonder is that it has been heard of at all, considering that its only qualities are large size and good color, while its flavor is anything but pleasing, and the substance of the berry is too tough for further mention. Mr. McLeish endorses these sentiments. Lady Hastings is, however, a good all around grape.

I have to go back to plants in order to refer to the splendid specimen tuberous begonias on exhibition. Paul Volquhardson took first and John T. Allen second. Gloxinias were also shown in splendid form; Mr. Volquhardson was also first with these and James Robertson, second. Specimen palms were immense, especially those exhibited by Colin Robertson from the Goellet greenhouses, which took first in all the classes; Charles D. Stark was second in the class for kentias. F. L. Zeigler took second in the class for any kind of palm with a fairly good specimen of *Phoenix* Roebeleni.

Commercial dealers and growers were represented at the show by Messrs. Henry A. Dreer, Julius Roehrs Company and Lager & Hurrell. In the exhibit of Henry A. Dreer were *Nephrolepis* todeoides and *N. Amerpohli* and the new double *Lobelia* Kathleen Mallard. Although there appears but very little difference in form in these two new varieties of *nephrolepis*, both show characteristics peculiar to themselves, which constitute improvements on those already in commerce. *Lobelia* Kathleen Mallard was also shown in the exhibit of Julius Roehrs Company, and both firms received an award for it. Henry A. Dreer, a certificate of merit, and the latter firm honorable mention. This *lobelia* seems destined for extended and varied usefulness; it appears to be adapted equally well for bedding and for finishing bench decoration in greenhouses. The flowers are perfectly double and of a good blue color.

The exhibit of Julius Roehrs Company was by far the largest of the three, and it contained many specimens of new and rare decorative foliage plants, including the following: *Calamus* ciliolare, *Dracena* Queen Victoria, a distinct improvement on *Dracena* fragrans var. *Lindenii*; this dracena has beautiful yellowish variegated leaves of graceful habit; *Alpinia* Sanderi, *Maranta* insignis. A striking feature of the exhibit were a few pans of *Cattleya* Gaskelliana showing from fifteen to eighteen flowers each; several new crotons were also noticeable in this exhibit, among them being *Louis Drops*, *Souvenir de Laken* and *Briellense*.

Messrs. Lager & Hurrell, as usual, showed a good collection of orchids in bloom, among them being *Vanda* teres, *Oncidium* crispum, *O. pulvinatum*, *Cattleya* Harrisonia, *Cattleya* Mendeli, *C. gigas*, *Lelia* grandis, *Cattleya* Gaskelliana.

The judges were Messrs. John T. Allen, Daniel Coughlan and Alexander MacLellan. The judges, officers and many prominent and large exhibitors along with the visitors were guests of President Butterton at dinner at the Perry House on the afternoon of the show. The attendance was fairly good.

Decorative Foliage Plants at Newport Show. Exhibit of D. McIntosh on right

CLUB AND SOCIETY DOINGS.

American Rose Society.

The executive committee of the American Rose Society will hold a meeting at the Hotel Martinique, New York, on July 24, to prepare a preliminary schedule for the exhibition in Chicago in 1908.

Prizes are already offered by W. A. Manda, South Orange, N. J., of \$25; also \$25 for La Detroit and special prizes of \$200 and \$100 for plants in pots. President Robert Simpson is planning for a European trip of some extent, to leave this country on the last of the month.

At this meeting a certificate for new varieties will be decided upon, also a certificate for life membership.

In some of the Hudson River towns the Crimson Rambler roses have been used the past few years as piazza plants and the spread of this beautiful flower has, in some cases, made a marked impression upon people showing the value of the rose as an outdoor decorative plant, which has scarcely been realized before.

BENJ. HAMMOND, Secretary.

Fishkill-on-Hudson, N. Y.

AMERICAN BREEDERS' ASSOCIATION.—The fourth annual meeting of the American Breeders' Association will be held in Washington, D. C., January 28, 29 and 30, 1908. The program will include addresses by many men prominent in the improvement of field and ornamental plants, experts in improving domestic animals, and scientists who are studying the principals of heredity. The announcement of the meeting says:

ST. LOUIS FLORISTS' CLUB.—The meeting of last Thursday afternoon was fairly well attended; twenty members being present, including all the officers, excepting Trustees C. Beyer and F. A. Weber, who were detained at home on account of sickness. President Irish was in the chair. Chairman Smith, for the trustees, reported that he was working single-handed owing to sickness of the other two trustees, but everything was in readiness to make things pleasant for the members and their friends at Romona Park Thursday afternoon, July 25, when the annual outing takes place. State Vice-President W. C. Young of the S. A. F. O. H., who has charge of the transportation and selection of the route for the St. Louis delegation, reported the rates from the different railroads, and the members decided to go over the Pennsylvania railroad, leaving here Sunday noon, August 18, and arriving at Philadelphia Monday 3 p. m. The fare for the round trip will be \$25 including a trip to the Jamestown Exposition and returning by way of Washington, D. C. Not before the next meeting will we know how many are going. Adolph Brix was elected to membership.

The nomination of officers resulted as follows: For president, W. C. Young, John Connon and John Steidle; for vice-president, George Augermuller and Edwin Denker; for secretary, A. J. Bentzen; for treasurer Professor H. C. Irish; for three year term trustees, Charles Schoenle and G. H. Pring were placed in nomination.

President H. C. Irish, on behalf of Director Wm. Trelease of the Missouri Botanical Garden, invited the members to hold the August meeting at the Garden and bring their ladies with them. This invitation was accepted with thanks.

Cutworms on Dahlias.

Dahlia culture, at this time of the year, has one great drawback, great in its evil results if in nothing else, namely, the smooth, plump, inert article known as the cutworm. Inert? Yes to look at, when one finds him curled up lazily in the ground in the form of the letter C, but the young and tender dahlia shoots that have been eaten off and now hang limp beside the plants, tell another story. Mr. Cutworm works by night; and unseen, and must be very agile in his operations when he is doing business. When you detect his ravages in the morning you can usually catch the culprit by digging about the plant with the fingers. Summary execution follows, of course, but alas! Mr. Cutworm leaves numberless relations to carry on the mischief, and to-morrow morning you shall find further damage done, and usually upon the varieties you cherish most.

When strong field roots are planted, having several strong shoots, it is of no great importance if the first shoot is cut off, especially if you have other roots of the same kind. When, however, as often happens, one sets out tiny pot roots, imported, perhaps, at large expense, with import duty and custom house charges added, it rather jars the feelings to find that several of them are spoiled every night; and with rooted cuttings the damage is sometimes irrevocable. It is true that a cut-off plant will often start again at the eye, but the loss of time before it starts is serious, and not infrequently a plant will be cut the second time with most deplorable results.

Now how to circumvent the cutworm is the important question. A little air-slaked lime spread about the plant will do the trick, one man says, but other people will tell you it does not seem to hinder the

THE OUTING OF THE NEW YORK FLORISTS' CLUB

"The economic significance of the effort to add several hundred million dollars annually to our plant and animal products through breeding will be discussed by Jams Wilson, Secretary of Agriculture, who is president of the American Breeders' Association, and by others interested in this work. The state experiment stations, the university laboratories, the Carnegie Institution, the United States Department of Agriculture and other scientific organizations annually bring of their best work to this association.

"Many national, state and local plant and animal breeders' associations are represented in the general association. Memberships are coming in from all over the world. In response to a recent movement to obtain funds for enlarging the work of the association, Charles Willis Ward of Queens, N. Y., has offered \$5,000 a year for five years on condition of this sum being duplicated by another person."

The American Carnation Society will hold its annual meeting in Washington on the same dates and some of the sessions will be held jointly with the American Breeders' Association.

NASSAU (N. Y.) HORTICULTURAL SOCIETY.—The monthly meeting of this Society was held on Wednesday evening of last week at the Oriental Hotel, President Mackenzie in the chair. Five propositions for membership were received. A. Jancke read a very interesting paper on "Hybridizing." There was a fine exhibit of sweet peas, Japanese iris, poppies, pot plants and potatoes. A silver cup for the Fall exhibition for the best collection of fruit was received from Titus and Bowne. It is thought that the date of the Fall exhibition will have to be changed.

The question box gave valuable information; several inquiries brought out a good discussion, especially those regarding dahlia culture and the workings of the Morehead trap.

The treasurer's report showed a good balance to the credit of the club.

The next meeting will be held August 8 at the Missouri Botanical Garden.

ST. PATRICK.

THE NEW LONDON (CONN.) HORTICULTURAL SOCIETY held a very successful show, which opened on Tuesday, July 2. Features of the exhibition were the Fourth of July dinner tables; one had a drum for a base for the floral centerpiece, and small cannon, flags and fire crackers carried out the idea admirably. Another had a floral ship "Independence" as a centerpiece, the National colors being represented by Canterbury bells, cornflowers, red geraniums and red and white carnations. A colonial garden was also an attraction. There was a duck pond in the center, the conventional straight paths and rectangular flower beds filled with grandmother's favorites, edged with box, a rustic arbor and a sundial completed the effect.

S. J. Reuter, Westerly, R. I., made a fine showing of roses, including the varieties Mme. Abel Chatenay, Killarney, Wellesley, Kaiserin Augusta Victoria, and Bridesmaid; also Enchantress and Mrs. Lawson carnations.

The judges were: Thomas W. Head, A. K. Anderson, and Louis Reuter.

"The Use Book," and "The Use of the National Forests," are the designations of booklets issued by the Department of Agriculture (Forest Service), Washington, D. C.

worms at all. Another remedy is to set out lettuce plants close to your dahlias, upon the theory that the worms will feast upon the succulent, tender lettuce and let the dahlias alone. Perhaps they will! Who knows? Another scheme which is said to work successfully is to mix a quantity of Paris green with wheat bran and put a spoonful or so of the compound hard by each plant as a protection. It is said that the worm will tackle the wheat bran first every time, and the Paris green will make short work of him. This is a plan said to be used by Connecticut tobacco growers, and is considered to be a "lead-pipe cinch." One gentleman informs us that he makes his planting ground black with Scotch soot before putting in his roots, and then washes it into the soil thoroughly by means of a hose. No cutworm he says is ever seen thereafter in soil thus treated.

The writer has a plan of his own not precisely original, except in detail. It is well known that a paper ring placed around young dahlia plants and projecting a couple of inches above the surface of the ground will often prove an effective barrier in keeping the worms away. They simply can't get at the plants to do them damage. The objection to this plan is obvious. For a small garden it may do very well, but where dahlias are planted by the hundred it becomes a time-killing operation. But if one uses a Neponset two-and-a-half inch paper flower pot, and tears out the bottom, a good many plants can be taken care of in a comparatively short time. The pots are shaped and ready for use—old ones will do just as well—and being of tough material they hold their shape during the critical time when the young growth is tender. After the plants become tough and increase in size, the pots can be gathered and thrown away.—ALPHA IN DAHLIA NEWS.

DIRECTORY OF RELIABLE RETAIL HOUSES

FOR THE RETAILER

The retail florist firms advertising under this heading will accept and fill orders for flowers and floral designs forwarded them by mail, telegraph or telephone, the usual commission of 25 per cent. being allowed.

\$25.00, payable quarterly in advance, will entitle the advertiser to a four-line card, under this heading, for one year, 52 insertions. For every line additional to four, \$5.00 will be charged. Four lines will average 32 words: each additional line, 9 words. Each advertiser receives one copy, free, of our Florists' Telegraph Code.

New York.

YOUNG & NUGENT, 42 West 28th St. We are in the theatre district and also have exceptional facilities for delivering flowers on outgoing steamers. Wire us your orders; they will receive prompt and careful attention.

MYER, 611 Madison Ave. My facilities for delivering flowers for any and all occasions are unexcelled. Can give prompt service to steamer and theatre trade. Telegraphic orders solicited. Telephone, 5297 Plaza.

Kansas City, Mo.

SAMUEL MURRAY, 1017 Broadway. I will deliver orders for flowers in Kansas City and vicinity promptly. A first-class stock of seasonable varieties of flowers always on hand. Wire me your orders.

Washington, D. C.

Chicago, Ill.

HAUSWIRTH, The Auditorium Florist, 232 Michigan Avenue. The quality of our work is of National repute, and we are prepared to execute commissions in first-class style in Chicago and its environs.

For reproduction on this page, we solicit from our readers engaged in the Retail Trade, good, clear photographs of subjects that are of general interest, such as store interiors, designs of different classes, new delivery wagons, etc.

A Midsummer Wedding.

A decoration at this season to be effective should be made to look as cool as possible. White flowers are most appropriate, or light colored varieties; scarlet or crimson are colors to avoid in very hot weather, as they are too suggestive of warmth, especially for indoor decorations. Cibotium Schiedei, Adiantum Farleyense, and many of the ferns are suitable for hot weather work. Water schemes should be introduced wherever practicable in the form of aquaria and fountains; the introduction of running water always has a cooling effect.

Large quantities of garden flowers were used at a prominent wedding decoration this week. The chancel was banked on either side with large branches of freshly

guests for this wedding, and they were divided off from the side aisles with festooned garlands of white sweet peas. An iron standard was placed at every sixth pew, surrounded with a specimen plant of Adiantum Farleyense; the garlands of sweet peas connected them one to the other.

The bridesmaids carried old-fashioned handle baskets, filled loosely with pink sweet peas showered on one side with lily of the valley. The bridal bouquet was made of mixed white flowers—Stephanotis floribunda, Eucharis amazonica and gardenias with a shower effect of lily of the valley. The ushers wore large boutonnieres of white sweet peas.

Dinner Decorations for Japanese.

Our Japanese visitors, who are again in New York, are great entertainers and the dinners given by them and for them have been brilliant features of the week. The visitors certainly wish to keep up the reputation of the "Flowery Kingdom" and insist on elaborate floral decorations for all their entertainments. A dinner given by Japanese last Sunday night was a fair example of their good taste in these matters. The table was sixteen feet long by eight feet wide; three center pieces of Richmond roses and lily of the valley were used, the pieces being arranged to represent the national colors. The roses in the center were surrounded by a broad band of lily of the valley. Fronds of Nephrolepis Whitmanii were laid on the table in regular formation, with lily of the valley and Richmond roses sprinkled through. The mantels at either end of the long room were banked with Adiantum Farleyense and Japanese iris in different colors. Iris were also used to decorate four columns in the room, which were connected by strings of Asparagus plumosus. Groups of palms filled in the corners of the room, being relieved by clusters of scarlet gladiolus.

The Japanese are extremely critical about their table; everything must be in good taste and the service immaculate, as they are very keen and detect the slightest fault.

Seasonable Stock.

Sweet peas are still to be had and although there are quantities that are very poor, some of them are extremely good in quality for so late in the season. They are certainly a most satisfactory flower to handle, and are especially useful for table decoration, as they hold well in hot weather. Some growers are sending them in with their foliage. In cases where the stems are short they are valuable for table work and where they can be obtained should be employed in preference to other green, as the natural foliage will always give better results.

Some specimens of the carnation Souvenir de Malmaison were shown on Twenty-eighth street this week, brought in by a Long Island expert, not long enough away from the "old sod" to forget this wonderful variety. The flowers were very fine, but they cost a fortune to grow, and orchids would be expensive at the figure placed upon them. This variety can scarcely be called a commercial carnation even in Europe, and as it is purely a Summer bloomer it would be of doubtful value to the city retailer, although it might prove a valuable addition to the Newport florists at this season.

Some large tubs of roses were an attractive feature of one of the principal stores this week; the plants were well flowered and an unusual sight for this time of year. The varieties were Debutante, Hiawatha, Lady Gay and the older, but none the less appreciated variety, Crimson Rambler. They make a beautiful display, and outlast cut flowers by several days for window decoration, besides being an attractive novelty.

D. RAYBUN.

Double Hollyhocks

Photo by John F. Johnston

cut pin oak, with fine specimen plants of Cibotium Schiedei showing out at various intervals. Large arches formed of heavy wire, provided with rings for the reception of tin cornucopias were hidden among the foliage; these latter were gracefully filled with long sprays of white phlox carrying out the conformation of the arches. Tin cornucopias, or properly speaking cemetery vases, were inserted into the pot flowers, and also filled with white phlox, forming a bank of flowers on either side of the chancel, the arches rising above. Two silver vases were placed on the altar; these were filled with Lilium candidum, and long sprays of Asparagus Sprengeri. Cornucopias were placed at every other pew and filled with white Iris Kämpferi. These flowers are admirable for decorative purposes, and keep perfectly well inserted in sphagnum moss that has been well saturated with water.

Only the two center aisles were used for the invited

WIRE GLASS IN THE ERECTION OF GLASS HOUSES.—This material for roof glazing is coming much into use in Germany. It is described as possessing many advantages over ordinary glass, either rough or ribbed plates, and polished glass, in its capability of withstanding hail, wind, pressure, blows, and atmospheric influences, most important facts for gardeners. The wire network is incorporated with the glass while the latter is in a fluid state; and the transparency of the material is not influenced thereby, it being as transparent as ordinary rough plate, and it may be purchased smooth or ribbed as may be desired. The wire causes only the smallest shade on the plant beneath the roof. The extra cost of the article is inconsiderable, and reckoning the durability of wire glass, it is said to be cheaper in the end. The raising of the warmth of the interior of wire-glass-covered houses is rather longer in point of time by sun-heat; on the other hand, the house parts with its heat more slowly, and those dangerous and sudden changes of temperature experienced in ordinary houses are avoided.—The Gardeners' Chronicle.

Retailers desiring a share of out of town trade should be represented by a card in this column.

Our London Letter.

BY A. HEMSLEY.

THE ENGLISH NATIONAL ROSE SOCIETY'S annual show, held at the Royal Botanic Society's Gardens on July 4, was a great success; even though the weather was most unpropitious there was a large attendance of visitors, and the Show was well worthy of the title of the Society. Queen Alexandra, who was among the visitors, expressed great pleasure in seeing such a fine exhibition of roses. Miss Willmott, a lady who takes great interest in all horticultural gatherings, was also present and conducted Her Majesty round the tents.

Owing to the weather few of the classes were not quite so well filled as usual. Yet all who could show had blooms of the highest quality.

In regard to new varieties the judges are always careful in giving awards. White Lady, Gustave Piganeau, Mrs. E. Hawley, Comte de Rambaud, Countess of Derby, Ulster, Lady Battersea and Richmond Liberty, Frau Karl Druschki, Madame Abel Chatenay, Captain Hayward, were among the better known sorts.

In the groups for competition Hobbies, Ltd (J. Green) came first with a fine arrangement of tall Ramblers, with vases of hybrid teas and other large flowers in the foreground. Of the Ramblers Dorothy Perkins, Hiawatha, Lady Gay, and Paradise were good. Cut blooms of Richmond, Margaret Dickson, and many other useful sorts were well arranged in the foreground.

Messrs G. Paul & Son, Cheshunt, had a similar group at the opposite end of the tent, but did not fill quite so much space, and though second the group was well arranged and the materials good.

And here I may mention that Queen of Spain, a fine hybrid tea, failed several times when submitted, but recently gained an award of merit, and secured the gold medal of the society at this show. A hybrid tea, Lady Helen Vincent, a bluish white with pink tinge, also secured a gold medal for the best of its class of recent introduction. Suzanne Marie Rodocanachi, from Messrs Alex. Dickson & Sons, gained a silver medal. This is a rose of fine form and a very clear and distinct shade of color. Mildred Grant was well shown by most exhibitors and gained a silver medal in the class for the best hybrid tea. William Shearn was another fine rose of a delicate shade of pink. Hugh Dickson was well shown. Crown Prince was the best deep crimson noted. White Maman Cochet was very prominent.

In the representative group of cut roses G. Mount, Canterbury, was first with a grand arrangement of fine blooms of the most useful sorts. Messrs Spooner & Sons, Woking, and Messrs Geo. Jackman & Sons, Woking, exhibited well in the same class. Messrs. R. Harkness & Company, Hitching, secured the champion trophy prize, for cut blooms, Messrs B. R. Cant & Sons and Messrs. F. Cant & Company were exhibitors in the same class. (72 varieties.)

Exhibit in Horticultural Hall, Philadelphia,

David Rust, Superintendent.

MAIN LOBBY
FIRST FLOOR

In the next class which was for 40 varieties three blooms of each, Messrs. A. Dickson & Sons, Newtownards, Ireland, were first; they were also successful in other classes. Among other good exhibitors were G. Pnce, Oxford; Messrs. Burrell & Company, Cambridge; T. Mattock, Oxford; Chas. Turner and Messrs. D. Prior & Sons, Colchester.

In the classes for roses arranged for effect single varieties were largely used, and the most successful exhibitors were those who made light arrangements of these.

There were several miscellaneous exhibits. Sweet peas from Messrs. Dobbie & Company, Rothsay, were very fine. Messrs. H. Low & Company, carnations, figs, etc; H. Crane, Highgate, a fine collection of violas; The Misses Hopkins, Folkestone, hardy flowers and rock plants. Messrs. Peed & Sons, Norwood, again exhibited gloxinias in good form.

S. A. F. Trade Exhibit.

We present in this issue a diagram showing the manner in which the floor space of Horticultural Hall, Philadelphia, Pa., will be apportioned for the forthcoming S. A. F. trade exhibit. David Rust, superintendent of the exhibit, informs us that space is being rapidly taken up, so that those intending to make a display should lose no time in securing their allotments, if they have not already done so. The exhibit, as well as the attendance, promises to be the largest in the history of the organization, and every progressive tradesman should, if possible, be represented by samples of his wares.

Carnation Aristocrat.

We herewith send you a photograph of the house of Aristocrat (reproduced in this issue). This is a photograph of the same house as you have previously published in your valuable paper, showing that the variety continues to produce a crop the year around.

Cultural Directions

Are leaflets written by practical men especially for the use of amateur customers.

If you have a counter trade, either in plants, seeds, flowers or bulbs, you should have a supply of these leaflets on hand to present to your customers when they seek cultural information about their purchases. (The leaflets embrace over forty subjects.)

We can supply them at \$2.60 per 1000, or 600 for \$1.50, and can make a reduction of those prices on large quantities.

At a small extra cost we can put your imprint on each leaflet.

Try a thousand and see what a help they are in selling goods.

The following "Culturals" are particularly reasonable for your customers at the present time:

Chrysanthemums, Dahlias, Hyacinths, Lawns, Lily Culture, Tulips, Freesia, Vegetables.

REVIEW OF THE MARKET

NEW YORK.—The cut flower business has reached its usual Summer status, and while the receipts of stock have been decreasing in some lines during the last few days, there is still more coming into the city than is needed, and prices vary little from last week's quotations. Where there has been any change it has been notably in the price of lilies, which went down to \$1 and \$2 per 100 on account of the large increase in supply. Speaking of lilies, we may also mention that Lillium candidum is in in quantities and does not average 50c. per 100.

Carnations are one of the things that have shortened up somewhat in supply; still we cannot see that averages will be any better, as there are still too many flowers for the demand. Gladiolus are coming in more heavily every day, and the standard prices seem to run from \$1 to \$1.50 per 100. Sweet peas are abundant and, in the main, poor. Roses of all kinds are plentiful enough for all demands, and as some new crop flowers are already appearing in the market, it would seem that there will not be much of a short season in roses this Summer. Asters are expected the latter part of this week. The demand for green material is at a very low ebb just now; much of it can hardly be disposed of at any price.

BOSTON.—There is little to write about these days because, as a rule, there is little doing. Carnations are getting small and begin to show signs of the end of the season's crop. There are no prices. Roses remain about the same as a week ago. Some good American Beauty are arriving and there are a few good roses of other varieties, but not many; the poorer grades, of which there are quantities, bring low prices. Sweet peas continue plentiful, and some good gladiolus are in the market. There are a few lilies and lily of the valley has a steady demand for a limited quantity. There are lots of other flowers in small quantities, but all sell at low prices. J. W. D.

J. S. BLOOM, Riegelsville, Pa.

CHICAGO.—Nothing seems to arouse the market from the condition of coma which overcame it several weeks ago, but as the supply of choice stock is still very limited and much of what is coming in is notable for its apparent lack of substance so that long distance shipping is largely cut out of the demand, the principal part of the daily arrivals, especially of carnations and roses, are jobbed off in large lots to the city trade.

The supply of carnations is still abnormal, and to this fact some attribute the low prices of roses and other lines as well, but other flowers, seasonable and of good quality, are not taken up as readily as they should be, and even with an almost entire absence of asters good gladiolus, auratum and candidum lilies and sweet peas find a slow market. Monday of this week saw in some quarters a perceptible improvement owing probably to the curtailment of the carnation supply which will become more apparent now daily.

Peonies from cold storage are still to be had in any quantity, and if they hold in good condition the supply is sufficient for some time yet at the present rate of demand. W. K. W.

ST. LOUIS.—The cut flower market is dull, both in wholesale and retail stores. While there is not much doing among the retailers, the wholesalers are having a hard time in filling their orders for first-class stock. One noticeable feature is that the supply of sweet peas has diminished somewhat; that is, the fancy grades; those coming in are too short-stemmed and are selling at 10c. per 100, and in 1000 lots for 75c.

Roses are still in poor shape. Of the lesser grades there are plenty; \$5 per 100 is the price for the best that come in, and from that down to as low as \$1 per 100. Bride and Bridesmaid are too small to be of any use. Kaiserin Augusta Victoria has the call for white; Richmond for red, and Killarney for pink. Souvenir du President Carnot sells well for any kind of work.

Carnations, too, are becoming too small and show the effects of the hot weather; the very best Enchantress do not bring over \$2 per 100. Boston Market is the best white; the bulk of this stock does not bring over \$1 per 100.

Asters are now coming in; white and purple are selling best. The price obtained for them is not over \$1.50 per 100, as the stems are too short yet. Gladiolus stalks bring \$3 to \$4 per 100, and have been in good demand.

In greens there is plenty of good smilax at \$15 per 100; also of asparagus, adiantum and fancy ferns.

ST. PATRICK.

INDIANAPOLIS.—Quantities of funeral work arrive spasmodically and then trade relaxes into the usual Summer channel. Counter business, though, is increasing yearly during the dull season, and a little effort on the retailers' part is well repaid. Boxes of select flowers for the sick room are also in constant demand. Good stock is not as plentiful as it was a week ago, and several varieties are obtained with difficulty. The local rose supply is very poor, and shipped roses are about the only ones to be relied upon. Good Killarney and Kaiserin Augusta Victoria are received at \$6 to \$8 per 100. A few Richmond are seen at \$4 to \$7, but this rose is too single at this season to be satisfactory. American Beauty are showing the effects of warm weather; ridiculously small are the buds, but prices remain about the same.

Carnations of any size are becoming scarce at \$1.50 to \$2 per 100. Harrisii and auratum lilies are selling well at \$12.50 to \$15 per 100. The first Lillium rubrum were offered this week at \$6 per 100. Asters of good quality, all colors, are in the market at \$1 to \$2 per 100. Field-grown gladiolus are shipped in at \$2 to \$3 per 100. The sweet pea season was a short one this year and not profitable as the incessant showers often damaged the blooms. A large crop of Shasta daisies is offered the store men at \$1 to \$1.50 per 100. The green goods line is well supplied. The surplus is shipped to St. Louis.

I. B.

ST. LOUIS, MO.—Sam Fine, 41 years old, of 6201 Olive street road, a florist, who slashed his throat recently, died July 8 at the City Hospital.

FIRMS WHO ARE BUILDING.

ROCKFORD, ILL.—Max Sadwater is building two large greenhouses. He was formerly in Belvidere, and has made plans for going into the greenhouse business quite extensively.

LINCOLN, ILL.—The firm of W. H. Gullett & Sons are making considerable change at their plant. Three of the large greenhouses that have stood on Tremont street for about fifteen years have been torn down and are being replaced by more modern structures, built upon the latest plans, with iron gutters, iron purlins and iron supporting posts.

CHANGES IN BUSINESS.

MELROSE, MASS.—Justus Geist has closed up his place of business on Main street and is now located at 85 Lynde street.

HANOVER, MASS.—Stanley Baker has given up the business of florist here and taken a situation with his father as caterer at Brant Rock.

LE MARS, IA.—A. S. Rollo, who has been conducting a greenhouse plant here for two or three years, has discontinued the business. He will leave shortly for Los Angeles where he will make his permanent home.

DAVENPORT, IA.—William Trillow, who has been with the Iowa Seed Company for several years, has leased the Lambert greenhouses, Twentieth street and Woodland avenue, and will engage in business for himself.

SHERMAN, TEX.—The Texas Seed Breeding Farm was organized here July 8. The purpose is bringing in all new kinds of farm seeds and to experiment with the same and to improve all the old sorts of seeds in general use on Texas farms. The stockholders are: John S. Kerr, W. H. Chisholm, A. Ladd, D. A. Simmons, A. M. Ferguson, W. A. Vinson, T. N. Cole and C. A. Sanford. The officers are: John S. Kerr, president; W. A. Vinson, secretary; C. A. Sanford, treasurer, and A. M. Ferguson, manager.

BERLIN, N. Y.—The firm of John E. Sambrook & Company has been incorporated with a capital stock of \$2,500. Peter Schroder is president, A. L. Schroder, vice-president; John E. Sambrook, secretary and treasurer. The concern will grow roses, carnations, and asparagus, and on May 1 last leased the greenhouses of Arthur Cowee, comprising about 15,000 square feet. These houses have been thoroughly overhauled and stocked. This is an entirely separate concern from that of Sambrook Brothers, Troy, N. Y., of which John E. Sambrook is the junior member.

CATALOGUES RECEIVED.

CONSIGNMENTS OF CHOICE CUT FLOWERS SOLICITED. PROMPT PAYMENTS. GIVE US A TRIAL

(2) Trouble with Crimson Rambler Rose.—I am sending you under separate cover a section of rose bush (Crimson Rambler) which appears to be attacked by a knot similar to black knot on plum trees. Will you please state if there is anything I can do to stop its spreading, as it is destroying all of our outdoor Rambler roses. R. R. R.

—The section of Crimson Rambler rose cane does not show any signs of disease, but it does show signs of decay at the joints where side shoots have been broken off or cut away carelessly, leaving places where moisture could accumulate. A careful going over of the bushes, cutting away all the dead side branches clean at the main stem will rectify the trouble, and save the bushes.

(3) Pansies.—Can I grow pansies by transplanting into the open field and mulching the plants with loose litter; and would they be early enough in bloom for Spring sales? D. S. C. Conn.

—Pansies transplanted to the fields and given a light mulch for protection during the Winter, come in all right, and flower in plenty of time for Spring sales.

(4) Removing Shading Material from Greenhouses.—We used as a shade on our greenhouses this Spring a solution of live lime and water and have been unable to remove it either by using washing powder or by using a brush and water. What do you think would be effective in taking off the shade without removing all the paint from the sash bars? J. G.

—When the glass is perfectly dry, the lime will rub off readily if a hard brush is used. After the lime is rubbed loose, wash the glass with the aid of the hose pipe.

(5) Soil.—Will you kindly inform me whether soil which has been used for indoor roses one season will be good to use in benches again for carnations and beans? SUBSCRIBER.

New York. —Use new soil by all means; that in which roses were grown last Winter is decidedly unfit to plant carnations in for the coming season.

VEGETABLE PLANTS
CELERY. We have Celery plants in unlimited quantity ready to ship in such varieties as Boston Market, Dwarf Golden Heart, Giant Pascal, Golden Self Blanching, White Plume, and White Solid, also Celeriac Giant Prague; and Moss Curled Parsley, \$1.00 per 1000; 10,000 and over \$50. per 1000, 25c. per 100 by mail postpaid. Philadelphia. News Notes. Everything this week is given over to the Elks. Business in the flower line is at a standstill. All decorations are done with bunting and flags, the only exception being the large decoration in the Mayor's office at City Hall; this was carried out by the William Graham Company, who used large quantities of palms, electric effects and an elk—a real animal stuffed. It has been conceded that this is the best decoration in the city.

Trade visitors in town are Fred. Roll, Durham, N. C.; Mr. and Mrs. Galloway, Toledo, O.; Jos. Schindler and J. van Gaffan, New Orleans, La.; Mrs. A. M. Briel, Baltimore, Md.; John Bader, Allegheny, Pa.; P. J. Hauswirth and wife, Chicago; J. T. Heal, Beverly, N. J.; F. Kramer, Washington, D. C.; C. Warneke, Detroit, Mich.; D. E. Gorman, Williamsport, Pa.; Mr. and Mrs. Robt. Hawkins, Bridgeport, Conn.; Wallace Felton and daughter, Baltimore, Md.; Steven Quion, Brookline, Mass.; Mr. and Mrs. Steven Moore and son, New Haven, Conn. A great many of these have availed themselves of the use of the Florists' Club rooms during the week, while the florists' supply houses and the commission houses have thrown their doors open to all visitors, giving them every attention. Bayersdorfer & Company gave their visitors a treat in the form of imported German beer, which Harry brought over with him for the occasion, he having arrived from Europe last week.

It has finally been decided to take the S. A. F. O. H. visitors to Belmont Mansion in Fairmount Park on the Friday of convention week. The entertainment committee is now busy working out the details and a good outing is anticipated. DAVID RUST.

BALTIMORE, MD.—The Maryland State Horticultural Society is planning to make the exhibition of fruits, flowers and vegetables to be held in connection with its annual meeting, December 5 and 6 next, at the Fifth Regiment Armory, the largest show of its kind ever given in the East. The society's executive board has issued an appeal to all persons interested in the promotion of horticulture to offer special premiums for displays of flowers, foliage plants or any new seedlings, and also for fruit and vegetable displays. The board itself will offer \$500 in cash prizes for exhibits. Mrs. Henry Barton Jacobs and Mr. George Hafer have offered more than \$80 in prizes for special floral exhibits. The members of the horticultural society include all the florists in and around Baltimore, as well as throughout the state, and they will all co-operate in making the coming show a success. The society's secretary, Prof. T. B. Symons, of College Park, Md., is now engaged in making up the premium list to publish, together with the announcement of the program for the meeting of horticulturists to be held September 24 at the Jamestown Exposition.

Charles Morton, the Cottage Grove Avenue florist, left the first of the week on his annual vacation trip to England. Dr. Mary Stone, a Chinese graduate of local medical schools, accompanied by her maid, attracted considerable attention at Winterson's the other day as she selected an extended assortment of seeds and novelties which she will shortly take to her home at Kin King, China.

The first annual horticultural show under the auspices of the Horticultural Society of Lake Forest at the Durand Art Institute on Saturday last was a most successful initiatory presentation of the flower, plant, and vegetable products of that delightful Summer suburb, "the Garden Spot of the West." The interior of the building was prettily decorated with oak boughs and other greens and the exhibits which were generally of a superior order were so numerous and extensive that the tables and floor space were more than comfortably filled. The non-commercial aspect of the affair was very pronounced, the E. F. Winterson Seed Store's pyramid of Boston ferns and other nursery stock by Swain Nelson & Sons Company being the only exhibits by business concerns. The prizes, which were in the form of ribbons and certificates, were awarded by a committee composed of William C. Egan, of Highland Park and E. A. Kanst and W. N. Ridd of Chicago. As an offset to the poor crop of early asters we are promised plenty of late ones which are now reported in excellent condition.

Schneider & Schoos are handling plants for greenhouse culture, samples of which they exhibit at their corner of the Flower Growers' Market.

Joe White of the J. A. Budlong force is away on his vacation.

Good growing weather has prevailed of late and the gardens are fast catching up with loss made earlier in the season.

The Summer horticultural show at Lake Geneva on Saturday July 27 is promised will be up to the high standard previously set by these annual events.

Henry Klunder will shortly leave for Fernbank, a suburb of Cincinnati, to spend his vacation with his family who are summing there.

Good weather for to-morrow, Sunday, July 21, seems the only remaining necessity to guarantee a pronounced success of the Florists' Club picnic at Morton Grove. The picnic grounds are new and were visited a few days ago by members of the committee, and everything will be in readiness. The price of tickets covering entrance to the grounds, railroad fare out and back, and refreshments, has been placed at 75c. for adults and 25c. for children. The committee owing to the generous response of the trade for financial assistance, has not been handicapped as on past occasions in making its arrangements and is also enabled to provide sweepstake prizes in addition to the generous list previously announced. The main body of the party will take the 9:30 train from the Adams street station, (Union Depot), and it is desired that all intending participants who can possibly do so will be on hand at that time, though John Enders will wait over until the 12:40 train to give the benefit of commutation ticket rates to those who are unable to take the earlier train.

Horace R. Hughes, who has become noted for his original methods of advertising his retail store at 690 West Van Buren street, has had some excellent photographs taken of some of his window and interior decorations as well as his deer park attraction and is having them reproduced on the back of post cards.

Some of the wholesalers claim that they are doing practically a normal business in dollars and cents but have to handle a much larger amount of stock to do it, while others claim that the demand is so limited that nothing will sell and laugh at the idea advanced in some quarters that the dullness of the market is caused by the abundance of outdoor flowers saying, "Where are your outdoor flowers? In previous years at this time we were receiving plenty of asters and double the number of sweet peas that are coming in now, but have been able to move them at some price. This year we can't even dispose of the reduced quantity of sweet peas."

"Is there danger of overdoing the peony business," was asked a large grower of that important specialty a

Chicago.**The Week's News.**

Leonard Kill, accompanied by Mrs. Kill and the Misses Kill, narrowly escaped what might have proved a serious accident on the morning of Wednesday of last week. When in a closed carriage shortly after leaving home the horses became unmanageable and dragged the driver from the seat to the ground. Being without control the horses ran at full speed and Mr. Kill, with the intention of attempting to run up to reach the horses' heads, opened the door and jumped out but was thrown to the ground sustaining scratches, bruises and a sprained wrist. The team was stopped by a member of the fire department. The ladies of the party were unharmed.

Miss Furlong, bookkeeper for Weiland & Risch, is spending her vacation with friends at Atlantic City.

N. J. Wieter and John Sinner returned from their fishing outing last week well bronzed, refreshed and pleased with their trip.

Sharp, Partridge & Company had a narrow escape from fire Wednesday night of last week when the building above them on the corner of Twenty-second and Lumber streets, occupied by the Chicago Wooden Ware Company, was destroyed at a loss of \$50,000.

Noah Fletcher, John M. Geddes, and D. C. Myers are recorded as the incorporators of the Spangler Cemetery Association at Decatur, Ill.

At the home of the bride's mother, 1841 Aldine avenue, on July 6, Miss Louise Pesther was married to Alois Frey, horticultural superintendent of Lincoln Park. Mr. and Mrs. Frey have since been touring neighboring Northern States and will shortly take up their residence at the above address.

J. W. Rodgers, superintendent of parks of Cincinnati, O., spent a few days in this city last week.

THE BEST WAY to collect an account is to place it with the National Florists' Board of Trade

56 Pine St., New York
WHY? Because many debtors will pay
the Board fearing otherwise a bad rating in
our Credit List. Full information as to
methods and rates given on application.

**SOUTHERN WILD SMILAX
BEAVEN'S FADELESS MOSS
NATURAL SHEET MOSS
E. A. BEAVEN, Evergreen, Ala.**

few days since and his opinion was ex-
pressed to the effect that such a condi-
tion was more than a possibility at no
very distant date especially in the less
desirable varieties. He said that the
unsatisfactory conditions surrounding the
market for cut flowers this year had dis-
couraged many, who were not florists,
who had intended going into the business
as a side issue, particularly mentioning
several school teachers who had planned
to invest their savings in peony farming
as a provision for old age but have con-
cluded that a savings bank is safer.

Louis G. Gresenz, for the past four-
teen years a member of the Bassett &
Washburn shipping staff, has branched
out into the retail business on his own
account having purchased the store and
good will of Mrs. A. Hertel at 150 Cly-
bourn avenue of which he took posses-
sion on Monday.

P. J. Hanswirth, accompanied by Mrs.
Hanswirth, left the city last Friday for
an Eastern trip including a visit to
Philadelphia to participate in the con-
vention of the Elks of which fraternity
he is a member.

John B. Deamud's son Wilder, after
a six years' course in St. Cyril College,
has entered the employ of the I. C. R. R.
in the freight claim department.

In addition to the generally admitted
value of the Killarney as a Winter rose
C. L. Washburn says that it is the
most satisfactory pink Summer rose that
his establishment has ever grown. Bas-
sett & Washburn make a specialty of
Summer roses and business in this line
is normal, being fully up to last year.

T. E. Waters, who has had charge
of the program for the picnic, com-
pleted the work on Monday, having filled
all the advertising space and turned the
copy over to the printers.

Among recent visitors to Chicago were
William Swinbank, Sycamore, Ill.; Mr.
Drake, Kenosha, Wis.; the Misses Flor-
ella and Nola Virgin, daughters of U. J.
Virgin, New Orleans, La., accompanying
their aunt, Miss Kate Rehm.

WILLIAM K. WOOD.

St. Louis, Mo.

News Notes.

The Florists' Club picnic, which
takes place Thursday, July 25, will be
largely attended should the day be pleas-
ant. Trustee Smith reports that all the
events have been arranged for, and hand-
some prizes will be given. A band of
music has been provided for the danc-
ing. The features of the day will again
be the baseball game between the whole-
salers and retailers, and the tug of war.

Now it is Frank Weber with a
sprained foot; this leaves "Billy" Smith
alone in the work of preparing for the
club picnic, as Carl Beyer is still on
crutches.

Mrs. William Ellison of the Ellison
Floral Company left last week to join
her daughter at Grand Rapids, Mich.,
where they will spend the Summer.

Fred. C. Weber, Jr., is spending his
vacation visiting friends in Denver and
Colorado Springs, Col.; he expects to be
back in time for the old folks to at-
tend the convention.

R. Brunz of Pacific, Mo., was a visi-
tor the past week; he consigns green
goods to this market. He attended the
club meeting last Thursday.

Mrs. A. Berdan, wife of the Kirk-
wood florist, died last Saturday morn-
ing after an illness of two years. The
body was sent to Hakensack, N. J., for
interment. Mr. Berdan has the sym-
pathy of the trade in his bereavement.

William Winter of Kirkwood, who has
done so well this year with carnations
and violets, is making preparation to
build two new houses this Summer.

Charles Schoenle and George Auger-
muller with their wives, spent a few
days fishing the past week.

We had with us recently L. White
and H. P. Richards, two of the Chicago
Park Commissioners, to inspect our park
system and boulevards. They, in com-
pany with Phil. Scanlon, our park com-
missioner, spent two days visiting the
parks. Before leaving they com-
mended both Mr. Scanlon and Superin-
tendent George Ostertag on the appear-
ance of all our parks.

George H. Pring, who has charge of
the orchid houses at Shaw's Garden,
will leave next week for a month's trip
to England, his former home; he will
return on September 1.

ST. PATRICK.

Louisville, Ky.

News Notes.

This city, on Tuesday, July 9,
was visited by a most severe wind and
rain storm. The wind for half an hour
or more registered sixty miles an hour
and over. This storm did much damage
among the old shade trees of the city,
uprooting and breaking many of them.
But it is hoped that a young tree will
be planted to replace each one destroyed,
and one of our daily papers (The Even-
ing Times) has taken up the slogan of
"A tree for a tree" and with the co-
operation of the Committee on Educa-
tion and City Beautiful of the Louisville
Commercial Club, it is expected that
every tree destroyed will be replaced
by another. This storm, did not cause
much loss among the florists beyond the
breaking of a small amount of glass and
the displacing of sash. The storm did
about complete the destruction of our
sweet pea crop.

Leo Zoeller is to be congratulated on
the arrival this week of a girl baby.

The vice-president for Kentucky, of
the Society of American Florists, Au-

gust R. Baumer, desires to inform the
craft of Kentucky that he is ready and
willing to give any information possible
regarding our national society, and
to receive annual and life membership
applications, especially the latter. He
has just sent in the application of U.
Kleinstark for life membership.

William G. Walker, son of and for a
long time with William Walker, is open-
ing a barber's shop next door to his
father's florist store. A. R. B.

Indianapolis.

News Notes.

The flower stand formerly at
Pennsylvania and Washington streets
has been removed to the Terminal and
Traction building. The proprietor com-
ments that his patronage has nearly
doubled since the change.

Alvin Schreiber has returned from a
visit with friends at Richmond, Ind.

E. T. Barnes, Spencer, Ind., states
that he will soon be in the market with
a heavy quantity of asters. An acre
of candytuft which he had planted was
found to be a profitable investment.

E. J. Bertermann and family are en-
joying Michigan for a couple of weeks.

George Weigand is contemplating an
Eastern trip.

S. S. Skidelsky visited the local trade
this week; he assures all the visitors to
the S. A. F. convention a most enjoyable
time. I. B.

Cincinnati, O.

News Notes.

J. T. Conger, Hartwell, O., has
bought the ground where his dwelling
and greenhouses stand, besides several
lots adjoining, which will give him
plenty of room to expand.

R. H. Warder, superintendent of Lin-
coln Park, Chicago, was in the city dur-
ing the week. Uncle John Lodder and
daughter, Hamilton, O.; Ben Eschner,
Philadelphia, and George Asmus, Chi-
cago, were also visitors.

Sunday the Elks commenced their
journey to Philadelphia. J. A. Peter-
son made the 4 1-2-foot wreath which
was placed upon the grave of Past
Grand Exalted Ruler Meade D. Det-
wiler at Harrisburg, Pa.

Mrs. H. A. Kresken and daughter
Adeline are spending a few months in
Europe, having sailed several weeks ago.

Louis Pfifer's Sons have given up
their store for the Summer.

The election of officers of the Cin-
cinnati Florists' Society took place Sat-
urday evening at the club room, the re-
sult being as follows. R. Witterstaetter,
president; Gus. Adrian, vice-president;
Frank Delmar, secretary; D. Rusconi,
treasurer; W. K. Partridge, trustee. D.
Rusconi was appointed a committee of
one to make arrangements for the an-
nual outing, time and place not as yet
designated. E. G. GILLET.

White Marsh, Md.

The firm of R. Vincent, Jr. & Sons
Company was incorporated on May 10
under the laws of the State of Mary-
land with a capital of \$100,000. The
incorporators are the senior member of
the old firm, R. Vincent, Jr., his wife
and three sons. They are now build-
ing on their grounds three new tenant
houses, occupants for which are wait-
ing to take possession. This makes ex-
actly a round dozen of tenant houses on
the place in addition to which there are
five houses inhabited by the principals
of the firm. Six new greenhouses, each
30x200 feet, running north and south,
are to be erected shortly. The glass, or
the greater proportion of what is needed,
is now on the grounds—\$800 boxes, size
16x24, double French. The company has
made a recent addition of some 56 acres
to its land holdings, and has now some
370 acres. In the new addition is a
fine piece of woodland ten acres in ex-
tent, in which a saw-mill will be placed
to afford the firm material for its box-
making. There is also a fine stream
which will be dammed and which will
furnish a plentiful water supply and do
away with the necessity of pumping
from wells.

George Myers, who, under the super-
vision of Mr. Vincent, has charge of the
geraniums and pelargoniums, and who
has been most successful in the culti-
vation of the latter, was married on
Monday, July 8, to Miss Mamie Sterling
of White Marsh. After a short vacation
Mr. Myers is again at his duties.

Newport, R. I.
News and Trade Notes.
Newport never had so many people as there are at present; there is not a cottage that is in any way fit for occupancy, untenanted in the city or its vicinity. These conditions worked and are constantly working to make this a splendid season for florists and dealers.
I have already in these columns stated that the demand for material for bedding out was if anything in excess of the supply; now that the time has come for the interior decoration of numerous houses it is coming to be known that there is a distinct scarcity of plants for the purpose. Large plants are much more in demand this year than usual. Large Boston ferns and specimens of the newer varieties of neuprolepis, are picked up quickly; there are two or three dealers out for every plant known to be for sale. Large pandanus are also called into service. I noticed Mr. Armstrong, manager for Wadley & Smythe, carting a number of what any person might reasonably call large kentias and arecas to the residence of Mr. W. M. B. Leeds; in an hour or so afterward about half the number were carted back again because they were too small for the purpose for which they were intended. This was no loss to Wadley & Smythe, however, because they had a place for them before they got to the store. Large palms are scarce.
Entertaining has already commenced. Mrs. Stuyvesant Fish, as usual, started the ball to roll. Messrs. Wadley & Smythe had charge of the decorations for the first large affair of the season, which was given at Mrs. Fish's residence "Crossways." The leaders of the Four Hundred have decreed that it is quite right for any of their number to go up to the end of the avenue, purchase a choice plant and take it home in the carriage or automobile. The consequence is, that it is a common incident the carrying of plants after their purchase by this class of people. This fact, as sad it will soon turn out to be, will benefit the florists immensely.
I suppose there is no use in being too particular about the use to which the flowers we sell or grow are put after they leave our hands or premises. Society dogs die after they get too old to live any longer, and sometimes dogs die because they have been too well off. Many of them are buried with much ceremony in graves in locations observable from the mansion windows; these graves are strewn with choice flowers at regular intervals throughout the year and covered in Summer with choice blossoms from the florist's store or the private greenhouse.
Bruce Butterton, president of the Newport Horticultural Society, is out and around again, after a siege of serious illness.
Carl Jurgens is seriously ill at the Newport hospital.
Messrs. Wadley & Smythe have placed Waldemar Barth in charge of the estate of Mrs. Herman Oelrichs temporarily.
There is a vacancy in the horticultural establishment of Mrs. T. J. Emery in Middletown; a gardener is wanted to take the place of Alex. Anderson, who has left there. Already many applicants are after the position.
There is a large range of glass in course of erection by the Pierson-Sefton Company for Senator Aldrich at Warwick Neck, R. I.; this range will comprise when completed, a house for the accommodation of a large collection of plants and for the growing of fruit and flowers.
Crotons are utilized here again for bedding out. Wadley & Smythe have purchased the whole of John Marshall's stock for the planting of the beds at Mrs. Oelrichs' place.
From present indications the September show of the Newport Horticultural Society will be a large affair. It is proposed to hold it in a large tent to be erected in a lot on Bellevue avenue.
Recent visitors included Messrs. S. G. Harris, Tarrytown, N. Y.; John S. Hay of Henry A. Drer; Tomas Knight, of the Julius Rohrs Company and George H. Struck, representing Lager & Hurrell and the F. R. Pierson Company. D. M.

S. A. F. CONVENTION TRADE EXHIBITION

All who desire space are requested to apply at once, stating what they wish to exhibit, and amount of space required; diagram will then be sent showing location assigned.
We have many choice advertising spaces; state how much you wish to expend, and we will select a good position:
DAVID RUST,
Superintendent of Exhibition,
Horticultural Hall, Broad St., below Locust, PHILADELPHIA.

New Hampshire Notes.

The effect of the cold late Spring is shown on every side. Vegetables are away behind what they ought to be, excepting potatoes which are looking well. Corn is in the poorest condition, and it is doubtful if much if any of the late varieties will come to maturity; hence those farmers who save their own seed may be forced to look to the seedsmen to supply their wants. The only redeeming feature is the hay crop which is about up to the average.
Among the florists there is little doing. In Laconia Mrs. Dow has closed up her central store, and on July 13 tried to sell her houses and stock at auction, but no sale materialized. The house are in poor shape and must be torn down. It is doubtful if glass enough could be saved to pay the expense of removal. A. W. Putnam, of Laconia has rapidly come to the front and is now the largest florist north of Concord.
There is very little building going on in any part of the state. CAROLUS.
Washington, D. C.
News Notes.
Reports from different members of the local trade show business for the dull season to be somewhat above the average in the stores and markets, while on the outside several have considerable landscape work of magnitude.
The Florists' Club is sending out letters of notification to the trade of their outing to be held on July 25 at Great Falls of the Potomac, the terminal of the Old Dominion railroad. The committee appointed by President Bisset consists of George C. Shaffer, chairman, F. H. Kramer, and Chas. McCauley, and the event is looked forward to with expectations of a good time for all. Special cars have been reserved for the florists, their families and friends, and will leave Thirty-sixth and M. streets N. W. at 2 p. m. sharp on July 25.
Dinner will be served at the Dickey Homestead. The committee has also arranged for different kinds of sports. The trip including everything will be \$1.50 for each person. JAS. L. CARBERRY.
SPRINGFIELD, MASS.—Last week burglars entered the dwelling house of Mark Aitken, florist, and secured \$60 which Mr. Aitken had in his trousers pocket.

THE FLORISTS' EXCHANGE

HAND & CO

How often have you heard some of your men say: "I wish the man who invented this machine had to use it himself for a while; then he might learn to make it so it wouldn't break a man's back to open the sash." Your men are dead right! That is just where the trouble lies, as designing a thing on paper and making it work satisfactorily in a greenhouse are different matters.

That "Oil Itself Gear" we make is a tried out proposition; it has been tried by the man who invented it—he knows just how hard and exactly how easy it works. When he, and the rest of us, were satisfied that it did work easier than others and would keep on working easy, we put it on the market.

You are safe in buying this Gear if you want an easy worker.

HITCHINGS and COMPANY

GREENHOUSE DESIGNERS AND BUILDERS. Manufacturers of Heating and Ventilating Apparatus

1170 Broadway, New York

HAND & CO

Utica, N. Y.

News Notes.

The usual Summer flower trade is with us, and the florists are making arrangements for their annual vacations. Wm. Pfifer and family go to Oneida Lake for the Summer; Peter Crowe and wife to the Adirondack Mountains; H. G. Martin, of Spencer & Martin, with his family, to North Bay, Oneida Lake for a part of August; C. F. Seitzer to Otsego Lake, a part of August, and J. C. Spencer of Spencer & Martin, and his family, go to their camp at Glenwood, Otsego Lake, Cooperstown, N. Y., from August 15 to September 15.

Dr. W. A. Rowlands of Whitesboro has a new man from the Dale Estate, Canada—Mr. Watson, a carnation specialist. Dr. Rowlands is building one new house, 27x100 feet.

Frank McGowan is rebuilding three houses and Peter Crowe is rebuilding three houses for his fern which never looked finer than at present. Wm. Hermant of Deerfield is building two new houses, of Lord & Burnham iron construction; and Sam. Pinkstone, two houses on a new location.

J. Godfrey has leased the greenhouse plant at 801 Genesee street; he is turning out some extra good sweet peas and will have them all Summer.

Gus. Du Moulin, New York Mills, is building one new house 20x80 feet.

Carnations in the field are looking very well, better than anticipated early in the season; it looks as if there would be a surplus here in the Fall. Enchantress has been largely planted, more so perhaps than any other variety.

H. G. Martin, who has rented his place for the past two years, is to plant it this year himself with Asparagus plumosus and A. Sprengeri for which there is quite a call here.

Florists' Club.

The meeting for June was held at R. Kilbourn's, Clinton, N. Y. About 20 members attended, had a very fine trip and spent a very pleasant evening with Mr. Kilbourn and family.

At the July meeting the club was entertained by Theo. Schesch of Ilion, N. Y. Over 30 persons attended. The club finds that it is the most successful way to hold our meetings by visiting with different members each month; it always brings out a good attendance. They have now members from Syracuse to Albany, from about every town on the New York Central road. This year we are to hold our clambake at Ilion, N. Y.; it is to be a stag party and makes our sixth bake, and will take place on August 14.

The Utica Florists' Club wishes to congratulate the Albany Florists' Club and hopes it will grow rapidly.

QUIZ.

MANCHESTER, MASS.—The annual rose show of the North Shore Horticultural Society was held on the grounds of the Essex County Club on July 10 and 11. Though later than last year the exhibition was in every way successful and a credit to the society and gardeners along the North Shore. The judges were E. O. Orpet, Joseph Clark, Jr., and James McGregor. Lager & Hurrell, Summit, N. J., made a fine

exhibit of orchids; Henry A. Dreer an exhibit of Nephrolepis Amerpohli and new double Lobelia Kathleen Mallard, and the Blue Hills Nurseries quite an exhibit of lilies and alstroemerias.

The most striking display in the exhibition was the group of foliage and flowering plants from Mrs. Lester Leland (Eric Wetterlow, gardener), for which the Connolly silver cup was awarded. The J. H. Troy silver cup, for the best collection of garden roses, was won by Mrs. James McLellan (F. Brash, gardener), for the third time and now becomes the property of the winner. The Julius Heurlin silver cup, for the best collection of herbaceous perennials, was won for the second time by Mrs. R. C. Hooper Estate (Wm. Swan, gardener), and now becomes the property of the winner. Other exhibitors of prominence were Mrs. Gordon Abbott (Wm. Irwin, gardener), Mrs. Philip Dexter (James Salter, gardener), Mrs. W. Scott Fitz (W. E. Allen, gardener), Mrs. M. B. Mason (John Reilly, gardener), and Mrs. W. B. Walker (Thos. Jack, gardener). J. W. D.

A Poem of Encouragement.

In one of the large florists' stores of Washington, D. C., where many novelties emanate, modestly hangs a hand painting of a spray of Richmond roses, beautifully executed by one of the clerks, on which is inscribed a poem he found too much obliterated to be wholly legible, and to which he supplied the missing verses. The poem is as praiseworthy as the art with which it is embellished, and is printed feeling that the truths contained therein will appeal to many readers. It follows:

"There's only one method of meeting life's test—

Jes keep on astrivin' an' hope for the best;

Don't give up the game and retire in dismay,

'Cause hammers are thrown, when you'd like a bouquet.

This world would be tiresome, we'd all get the blues,

If all the folks in it held just the same views;

So finish your work, show the best of your skill;

Some folks won't like it, but other folks will.

If you are leading an army or building a fence,

Do the most that you kin with your own common sense.

One small word of praise in this journey of tears

Outweighs in the balance, 'gainst a cart-load of sneers.

The plants that we're passing as commonplace weeds

Oft prove to be jest what some sufferer needs;

So keep on agoin', don't stay standin' still.

Some people won't like you, but other folks will.

Efficiency, Durability, Convenience.

That's what you are looking for when planning new houses.

Write us when you contemplate building.

N. COWEN'S SON,

14 & 16 Wooster Street, NEW YORK

WILLIMANTIC, CONN.—The trustees of the Connecticut Agricultural College at Storrs have appropriated money for the erection of a horticultural building, which will be a two-story structure, 40x70 feet with a large basement, also money to erect several greenhouses and other minor buildings to be used in connection with the work in horticulture. Three of these greenhouses will be 75 feet long. There will also be a smaller structure located nearby to be used as a forcing house. The new buildings will be of great service in extending the work of the college in this department.

GROW MUSHROOMS

If you do not know how, procure that simple but complete and practical book called "How to Grow Mushrooms." The price is ten cents and it can be secured from this office.

Special rates will be made to the trade who wish to supply their customers.

cannot be surpassed. Our workmanship also cannot be excelled. When you get a greenhouse from us you can be sure it is up-to-date in all respects, and that it will be a good house for many years.

FOLEY MFG. CO.

Western Avenue and 26th Street,

CHICAGO.

Our visiting friends are heartily welcome to call and see us at our handsome new factory. Transfer from any West Side street car to the S. Western Ave. line and get off at 26th St.

MASTICA

FOR Greenhouse Glazing

USE IT NOW.

F.O. PIERCE CO.

170 Fulton St., NEW YORK

Mastica is elastic and tenacious, admits of expansion and contraction. Putty becomes hard and brittle. Broken glass more easily removed without breaking of other glass as occurs with hard putty. Lasts longer than putty. Easy to apply.

FOR TEN CENTS

you can get our instruction book containing a thousand ideas on how to build a modern greenhouse. It's of great value to everybody who has a greenhouse or is making repairs of any kind on one.

This book tells all about the construction and just how each and every piece is put together, even to the nailing of drip moulding on a wooden gutter. It is handsomely illustrated and you will find it a valuable book to have handy.

Answers all construction questions when building.

We will send a new catalog with every instruction book if you write now.

STANDARD Pumping Engines

Are more reliable than
wind mills, cost less to keep
in repair, and furnish much
higher pressure.

The Standard Pump & Engine Co.
CLEVELAND, O.

The Standard Steam Trap

is acknowledged the best for
the Florist, because it is dur-
able and does its work without
trouble and annoyance, saving
its cost by the economy in coal
bills.

E. HIPPARD
Youngstown, Ohio.

REMEMBER! FLORISTS, REMEMBER.

That we manufacture Steam and Hot Water Boilers.
That we contract for and erect Heating Apparatus.
That we make a specialty of curing defective apparatus.
That our staff of Heating Engineers is reliable and competent.
That our Mechanics—pipe fitters—boiler makers, etc., are all
first-class.

That it will pay you to get our suggestions and estimates.

EMIL GLAUBER, Montclair, Colo.

THEN there's another vital side to this
using of one immense boiler to do
all your work, instead of two, three, or
four economical sized Burnhams in
battery.

To increase the size of the large boiler once it's in, is im-
possible, so you are apt to buy one that's a great deal too
big, in anticipation of your need when you put up more
glass. That all too large boiler will all the time be burning
an excessive amount of coal no matter how scientifically
you fire. With the "Burnham Way," in Battery, you put
in boiler capacity enough to meet your needs now and burn
only enough coal to economically meet them.

When more glass is added, you add
more sections to your boilers without
disturbing the piping or changing the
base. You see that's just plain common
sense talk, no "hot air." Send for our
newest boiler catalog and get the very
latest on this boiler question.

Vol. XXIV. No. 4

NEW YORK AND CHICAGO, JULY 27, 1907

One Dollar Per Year

HYDRANGEAS

For Summer Blooming.

We have a magnificent lot of Hydrangea Otaksa grown especially for JULY AND AUGUST FLOWERING. The plants are just coming into bloom, just beginning to show color, and will be in perfection during July and August, when they are in great demand at watering places and other summer resorts. There is nothing showier or more satisfactory for lawn decoration. We make a specialty of them, and find an increasing demand for them from year to year. They can be shipped anywhere safely by freight.

Large plants in tubs, \$2.00 to \$3.00 each, according to size; Very large specimens, in half barrels, \$5.00 and \$7.50 each.

PREPARE FOR CHRISTMAS

Novelties, always sell during the holidays. If you have not already grown them, try some Pink or Rose Speciosums. If potted in July, will flower for Thanksgiving and Christmas. Always useful either for cut flowers or plants. Ask the leading florists in Pittsburgh, Cleveland, Detroit, Buffalo, or around New York City. Order to-day. Will ship any time.

Cold storage Lillium longiflorum take about two months to bloom from time of potting; speciosums from five to six months, so that longiflorums wanted for Thanksgiving and Christmas should be planted about Oct. 1, and speciosums in July.

All Cases are Re-packed Before Shipment

Lillium Loogiflorum Multiflorum , 9 to 10-in. bulbs, 200 in case, \$11.00 per 100; \$100.00 per 1000.	Lillium Speciosum Melpomene , 8 to 9-in. bulbs, 200 in case, \$9.00 per 100; \$80.00 per 1000; 9 to 11-in. bulbs, 150 in case, \$12.00 per 100; \$115.00 per 1000.
Lillium Speciosum Robrum , 8 to 9-in. bulbs, 200 in case, \$8.00 per 100; \$75.00 per 1000; 9 to 11 in. bulbs, 150 in case, \$12.50 per 100; \$110.00 per 1000.	

Full cases sold at 1000 rate.

Seed Trade Report.

AMERICAN SEED TRADE ASSOCIATION

George S. Green, Chicago, Ill., president; M. H. Duryea, New York, first vice-president; F. W. Bolgiano, Washington, D. C., second vice-president; C. E. Kendel, Cleveland, O., secretary and treasurer; Leonard H. Vaughan, Chicago, assistant secretary.

During 1906 the United States sent to Belgium 2,018,764 pounds of cotton seed.

PHILADELPHIA, PA.—Robert Buist, daughter and granddaughter sailed Saturday for Europe, on the steamship Philadelphia from New York, for several weeks' stay.

KENDALVILLE, IND.—A local paper states that A. E. Kumdred, a gladiolus grower, has suffered considerable loss through recent heavy rains and a consequent overflow on his land.

IMPORTS OF SEEDS, ETC.—July 15.—H. Frank Darrow, eight packages seed. July 17.—Capens & Sons, five bushels seed; Department of Agriculture, one case plants. July 18.—J. M. Thorburn & Company, four sacks seed. July 20-21.—H. Nungesser & Company, 600 packages seed.

LOUISVILLE, KY.—Wood, Stubbs & Company, seedsmen, had the misfortune to have their establishment gutted by fire and water on July 18. Their loss is estimated at about \$25,000. They have opened a temporary store near their former location, where they will transact business, until they secure permanent quarters. A. R. B.

COLOMBIA SUSPENDS DUTY ON CORN.—Under date of June 26, Consul Pierre Paul Demers, of Barranquilla, reports that, in view of the late disasters caused by the locusts on the Atlantic coast, the Colombian Government has just issued a decree placing on the free list until November 1, 1907, all importations of foreign corn through Atlantic ports—Cartagena, Barranquilla and Santa Marta.

TOLLEDO, O.—Fire broke out during the night of July 19, next door to the Wm. T. Phillips Seed Company, Monroe street, and rushing up the freight elevator, in the Phillips establishment spread rapidly over the third floor, which was used for the storage of wagons and buggies, ruining everything completely. The fire department was soon on hand and extinguished the flames before all floors caught fire. All the seeds, fertilizers and other goods got water soaked and the seeds may be called a total loss. The sympathy of the trade is with Mr. Phillips. The loss is covered by insurance.

THE CALIFORNIA SEED BOOM.—The climate of California has so shown its fitness for seed production and the enterprise of her growers is so keen that California-grown seeds, both flower and vegetable, in great variety bid fair to displace the products of other portions of the world. Many kinds are so plentifully produced that they find their way into the most distant markets, to the exclusion of home products. "California-grown" has taken the place of "northern-grown" as an advertising catchword and by sheer insistence is made to imply special merit in the mind of the casual buyer. Planters, however, are beginning to realize that any obvious superiority of Pacific coast seeds over

those of home production lies in the special skill and care of the grower and not in the locality. Comparative trials often show that California seeds have a tendency to rapid deterioration of type, possibly because the stimulating climate favors too heavy setting, causing loss of vitality in individual seeds. In practice it is becoming evident that to keep up the high grades needed by commercial gardeners it is necessary to continue growing the stock seeds of many varieties here in the East under normal conditions, but careful supervision, and from these revitalized seeds produce the commercial seed crop in California. This is not the case with all varieties, especially such heat-loving legumes as the Lima bean, which is at home under the cloudless skies and ardent sun of California and yields far better than with us. The "northern-grown" idea has nearly passed. Except that some inclination to early maturity is favored by seed growing in high latitudes there appeared nothing to justify the great claims made. When economic and climatic conditions do not forbid seeds are best grown where the subsequent crop is to be produced.—*Itrual New Yorker.*

COWPEA SEED.—The continuous wet weather of the Autumn of 1906 worked an especial hardship to farmers in connection with the various kinds of agricultural seeds set aside for this year's planting. This is particularly true with reference to seed of the cowpea, the principal leguminous, hay, and green-manuring crop in the States bordering on the Gulf and along the Atlantic coast as far north as Virginia, the excessive rainfall causing the seeds to mold and soften.

During ordinary seasons cowpea seed sells for from \$1.50 to \$2 a bushel, but this year it has readily brought from \$3 to \$3.50 a bushel. Notwithstanding this high price, the farmer has found that the vitality of the seed has become so impaired that only a very small percentage has germinated, and in consequence of this poor quality of seed the crops grown have been thin and most unsatisfactory.

As red clover and alfalfa are not generally grown in the South and the maintenance of profitable agriculture and soil fertility is largely dependent upon cowpeas, this condition has entailed very serious consequences on many Southern farms.

The Seed Laboratory of the Bureau of Plant Industry of the United States Department of Agriculture has recently collected samples of cowpea seed from the States of North Carolina, South Carolina, Georgia, Florida, Alabama, Mississippi, Louisiana, Arkansas and Tennessee, to the number of 3,706 packages, and these samples have been carefully tested for vitality. The results obtained have been startling.

Henry F. Michell Company

1018 Market St., Philadelphia

Our Advance Price List of Bulbs is ready.

While a good grade of seed should show a germination of from 95 to 98 per cent., the seed from four States only—Arkansas, Tennessee, Louisiana and Florida—showed an average germination of as much as 60 per cent., and only four varieties of cowpeas contained as many as sixty live seeds in each hundred—the Iron, Taylor, Whippoorwill and New Era varieties. In the remaining five States from which samples were secured and with the ten or more staple varieties of cowpeas not named above, the average percentage of germination reached from 49 to 59 per cent. only.

In these tests the Iron variety, which stood first, showed a general average of 79.2 per cent., while the Unknown variety averaged but 52 per cent., the Brown Eye less than 53 per cent., and the Black only 53.6 per cent. After the Iron variety the next best record was made by the Taylor variety with 68.8 per cent., and after that the Whippoorwill with an average germination of 66.7 per cent. Next came the New Era variety with a general average of 64.2 per cent., while the fifth on the list, the Clay variety, dropped to 58.7 per cent. In these tests, and the Black Eye and the Red Ripper showed 57.5 and 56.9 per cent., respectively.

According to the figures obtained in connection with the tests mentioned, the Whippoorwill is the most popular variety, with the Clay second and the Unknown third.

Farmers are urged to test seed before sowing in order to determine its vitality and in this way avoid disappointment and serious loss. This testing can easily be done by means of two dinner plates and a strip of cotton flannel. One hundred seeds should be counted out from the package of seed which it is proposed to sow, taking the seeds just as they come without making any selection. These seeds should be placed on one end of the wet flannel and laid in one of the plates, while the other end of the cloth and the other plate should be placed over them. On the third, fourth and fifth days the number of seeds which have sprouted should be counted and in this simple way the percentage of seeds which would sprout if sown in the ground can be definitely ascertained.

NURSERY STOCK AND SEEDS FOR CHINA.—Vice-Consul Vollmer, writing from Tsingtau, gives the following account of the newly created demand in that part of China for fruit trees and vegetable seed which, he thinks, American nurserymen should supply:

The German forestry department for the Kiaochow territory, with headquarters at Tsingtau, has within the last few years planted a large acreage in forests, using mainly acacias, but also oaks and many varieties of pine. Aside from this purely forest work a large experiment station is located at Tsingtau.

At this station extensive investigations have been conducted with pear, apple, and plum trees from Germany and California; cherries from California, and native peaches and apricots, besides berries of all sorts. The success with this imported stock has been so satisfactory that the fruit business will be entered into on a large scale and it is hoped to make Shantung one of the greatest fruit-exporting countries in the world.

In order to expedite matters and create an interest among the native farmers, 66,000 grafted and budded young trees were distributed free among the Chinese last year, and even then the demand was not nearly filled. Local farmers grow mainly pears, apples, and grapes, the port of Tsingtau exporting 3,000,000 catties (catty 1 1/3 pounds) of these products last year. Native pears brought 4 cents, while those grown from trees of foreign origin brought 9 cents per catty. Local and foreign apples were worth 7 and 17 cents per catty, respectively.

It would thus seem that the California fruit trees and their merits are known to the German officials, but the native simply knows that he can get a few trees free from the forestry department. Seeing the higher price the fruits from foreign trees bring, the Chinese are naturally anxious to get as many trees as possible, and this causes a shortage. With the German Government fostering the fruit industry and every possibility of its high development in this district, a great field should soon be opened to the American nurserymen. California trees have proved successful here, and, with

a rapidly growing demand, it would pay Americans to go after the business.

In conjunction with fruit trees, a large seed business could be worked up in this district. Owing to the system of fertilization, Chinese vegetables are very unhealthy and are not eaten by foreigners. The result is that every family has a vegetable garden. Small packages of seeds, the same size as in America, sell for 10 cents Mexican (5 cents gold). All of these goods come from Europe; but if the Americans would introduce their seeds, allowing the unsold packages to be returned at the end of the season, as is the practice in America, there is no reason why the trade could not be diverted. Natives would probably buy what seeds were left over at a reduced price, and thus do away with the expense of reshipping to the United States. This business could be worked up all over the Orient, as the conditions are similar, and would seem to be worth seeking.

European Notes.

To seed growers the subject of the weather is one of perpetual interest. Whether or no, he must be constantly discerning the signs of the sky, for in a greater measure to him than to most men the orderly course of the season brings success, while disorder spells failure. The moral of this moralizing is, Mr. Editor, that we are still far from happy, for with the solitary exception of England, where the sun has driven the thermometer up to 100 degrees for two days in succession, with a shade temperature of 65 degrees, and not a drop of rain has fallen for more than 24 hours, Europe is still enjoying fires, while rubbers and overcoats are still in order.

Everything goes on swimmingly, but there is yet time for a fair crop from the plants that are still standing. Some exceptions must, however, be made to this of which the first and greatest is onion. During the present week a few occasional outbursts of bright sunshine have developed the appearance of mildew in the stems, and growers fear the worst. Spinach, where it is growing on heavy land, is turning yellow before the seed is half developed, which means a big reduction in the crop. Where it is growing on lighter land it looks well. Rutabagas are booming just now; the advance reported a few weeks back being fully maintained. As the crop in France, Germany and England is practically nil the English growers have a look in for once.

Beet and mangel look splendid, and up to the present the attacks of dolphin are very rare.

As regards flower seeds practically nothing has yet been harvested. The severe frost of July 3 played havoc with the nasturtiums; in some cases fully 50 per cent. of the plants have perished. On the plants still living the leaf has been developed at the expense of the flower.

Sweet peas are coming into bloom very slowly, but as the plants are strong a good crop may yet result.

W. Protin of J. M. Thorburn & Company is in France. W. H. Maule has left for America.

S. B. Dicks returns to-night from his annual visit to the seed grounds of France, Italy, Germany and Holland. He reports that the weather all around is the most wretched he has ever known, but doesn't despair of some good crops even now, of **EUROPEAN SEEDS.**

NOTES FROM HOLLAND.—The lifting of all bulb crops being fully ten days later than usual, owing to the cold and backward Spring, nearly one-half of the tulip crop and quite as much of the hyacinth crop is still to be lifted and nothing definite can as yet be said as to the results.

So far, the tulips that have been lifted are satisfactory, and such of the young stocks of hyacinths that are out of the ground look fine and healthy.

The consequences of such an unusual backward season are, however, sure to be felt all through the season, as the time lost now cannot be made up again later on, and shipments will also have to be delayed quite as much as the lifting of the crops. The continued rains are also seriously interfering with the drying and curing of the bulbs lifted and is causing more delay that cannot be avoided.—*Horticultural Trade Journal.*

Pansy Seed

"STOKES STANDARD PANSY MIXTURE." The finest strain of Giant Pansies it is possible to produce. Trade pkt. 50c., 1/2 oz. \$1.00, 1/2 oz. \$3.50, 1 oz. \$6.00.

Plant Notes.

PHOENIX ROEBELENI has in the past been seen grown in pots so large in proportion to the size of the plants as to give persons who were unacquainted with it the impression that it could not be successfully grown into specimens in pots of proportionate size. At the recent exhibition of the Newport Horticultural Society there were on exhibition several handsome, medium size, shapely specimens of the plant in pots no larger than are commonly used for like stock of other varieties of phoenix. Plants of this palm about two feet high are very desirable as single specimens for decoration; the smaller sizes of plants are likewise very useful for filling small jardinières and other receptacles.

FITTONIAS, MARANTAS and small well colored plants of Pandanus Veitchii make up exquisitely when used together in dishes or baskets. Panicum variegatum, when used sparingly, helps to color up such work, besides giving it a light, graceful finish.

LANKY CROTONS with tops of good color can be used to advantage in the filling up of fireplaces and in the formation of plant groups in any part of dwellings. Dracaenas of like character can be used in a similar way. These plants work wonders when skillfully and tastefully arranged along with palms and other plants of a dull color. These crotons and dracaenas will come in handy later on for furnishing propagating material for fresh stock.

Any of the above noted plants not needed, and not good as specimens, can be planted out in the open and taken up later for stock.

COLEUS IN POTS FOR DECORATIVE WORK.—We do not often nowadays grow or see grown coleus in pots of large size for use indoors in Summer, but they are grown and used for that purpose nevertheless. At the Newport show Charles D. Stark put up an effective group of these plants; they embodied as a whole colors innumerable and tremendously gorgeous. These plants were bushy and well developed, and every one had a flower spike—a condition not usually associated with coleus; but the long graceful spikes of insignificant flowers took away from the stiffness of the plants and added gracefulness instead.

Coleus grown in this way can be used in sun parlors or enclosed piazzas, and fill up and look well even for a time.

GLOXINIAS.—Now is the season of these plants, which are charmingly effective for house decoration of various forms when used either as single specimens in pots or in larger numbers. Red is the most effective color for indoor work.

TUBEROUS BEGONIAS are now at their best also, and they rival gloxinias in the bright, cheerful effects they produce when used for the decoration of the interiors of dwellings or public buildings. Tuberous begonias are in the matter of gracefulness of habit far ahead of gloxinias, furnishing also a wider range of color.

LOBELIA KATHLEEN MALLARD, now being introduced and offered for sale by Henry A. Dreer and Julius Roehrs Company is just the kind of thing that private and commercial growers will certainly make use of in various ways. Commercial men buying it now from the introducers will no doubt realize considerable from the sale of the plants to retailers. It can be easily propagated at almost any time of the year from cuttings, and grown quickly into nice, compact plants in full bloom. There are not too many things in existence that can be easily made into salable stock of the color and compact habit of this lobelia. It can be used for bedding to greater advantage than any of the single varieties, because of the profusion of the double blue flowers and the more compact and self-restricted character of the plants.

NURSERY DEPARTMENT.

Conducted by Joseph Meehan.

AMERICAN ASSOCIATION OF NURSERYMEN.
J. W. Hill, Des Moines, Ia., president; C. M. Hobbs, Bridgeport, Ind., vice-president; George C. Seager, Rochester, N. Y., secretary; C. L. Yates, Rochester, N. Y., treasurer.

The death is announced of Eugene Louis Célestin Barbier, Orleans, France, on June 22, in his 58th year.

BRIDGEPORT, IND.—C. M. Hobbs, the senior partner in the firm of Albertson & Hobbs, has purchased the nursery interests of Emery Albertson. Mr. Albertson retiring from the firm by mutual and friendly agreement. C. M. Hobbs, O. A. Hobbs and Harry W. Hobbs succeed to the business under the firm name of C. M. Hobbs & Sons.

NUT GROWERS' ASSOCIATION.—The sixth annual convention of the National Nut Growers' Association will be held at the Jamestown Exposition, September 26-28. The meeting follows that of the American Pomological Society, which closes on the morning of the 26th. An interesting program has been prepared, copies of which can be obtained from Secretary J. F. Wilson, Poulan, Ga.

MILFORD, I.A.—H. N. Antisdell, who for several years past has been operating the Fostoria Nursery and Fruit Farm, has decided to branch out in business, and as a consequence has taken in as partner O. H. Koehler, of Estherville, an experienced tree man, and under the name of the Milford Nursery Company will put up an office and large packing house in Milford. Several lots have been acquired and will immediately be planted with evergreens.

FOREST PLANTING ON THE SEMI-ARID PLAINS.—Circular 99 of the Forest Service of the Department of Agriculture is devoted to this subject. The suggestions contained in the circular apply to the western portions of Kansas, Nebraska, and Oklahoma, northwestern Texas, eastern Colorado, and eastern New Mexico. Trees recommended for planting are: Russian mulberry, osage orange, green ash, black locust, honey locust, cottonwood, white elm, hackberry, hardy catalpa, box elder, red cedar, and various pines, among them *P. sylvestris*, *P. austriaca*, *P. divaricata*, and *P. ponderosa*.

THE PACIFIC COAST NURSERYMEN'S ASSOCIATION, with a membership of 114, held a successful convention at Salem, Ore., beginning July 11, in connection with the Salem cherry fair.

President H. C. Atwell of the Oregon State Horticultural Society touched upon the keynote of the situation in fruit growing when he pointed to the scarcity of labor. To such a critical state has this scarcity arrived that Mr. Atwell suggested the possibility of importation of contract labor by government under strictly defined limitations for agricultural work, to be returned to their own country at the expiration of the specified time. It is said that 50 per cent. of the prune crop of the Willamette valley went to waste last year for want of harvest labor.

The nurserymen's association elected the following officers: President, W. D. Ingalls, North Yakima; secretary and treasurer, C. A. Tomneson, Tacoma; vice-presidents, M. J. Henry, Vancouver, B. C.; W. K. Spalding, Sunnyside, Wash.; A. Holladay, Seapooose Ore.; Fred Nelson, Fowler, Cal.; O. A. Smith, Blackfoot, Idaho, and P. A. Dix, Salt Lake, Utah.

A magnificent display of cherries shows what may be expected of Willamette valley in this branch of fruit growing. Andrew Vercher of Polk county took the sweepstakes cup with an exhibit of Lamberts.

Increasing Strawberry Plants.

Florists and others who have sales for strawberry plants would find it easier to raise the young plants from cuttings than from setting pots under plants growing outdoors. The old plan, and the one still followed by many persons, was to place pots in the ground around the plants, sinking the pots to the level of the ground and letting the young plants rest on the pots, a stone or lump of soil keeping the plants in place in the center of the pot. This plan is the only one to follow to-day in case of plants valuable for their rarity, as many of the newer strawberries are, because as the runner grows it continues to make plants—from a half dozen to a dozen on each one.

An easier way to get plants, where every one the old plant makes is not looked for, is to cut off the young plants as soon as they show young roots forming, and pot them at once, placing them in a greenhouse or a close frame for a short time. It takes but a few

days at this season for a young plant to brighten up and a short time after for it to fill its pot with roots, when it is in condition for shipping and planting.

As soon as a strawberry plant has roots enough to sustain itself it is better planted than kept longer in a pot. It gets hold of the soil and becomes a good plant by Fall, giving a fair crop of fruit the following season.

Pot plants of all sorts are so satisfactory to both buyer and seller that it is no wonder the keeping of all kinds of stock in pots is becoming a prominent feature in many establishments.

Magnolias from Seed.

As the season when magnolia seeds ripen will soon be here some hints on the management of them will be of service to those who expect to raise seedlings. The seeds should be procured as soon as the "cones" containing them are ripe and open to display them. As known, the seeds have a pulpy covering and this covering must be cleaned from them. To effect this to best advantage mix the seeds with twice their bulk of damp sifted sand. Let them remain in this for two or three weeks, in the

at that season, for it has its foliage, flowers and berries to recommend it at other seasons, it is, certainly, of great interest in Winter, more so than many of this class of trees are.

The weeping dogwood was found wild in the woods of Maryland by a Dr. Thompson, who sold it to the late Thomas Meehan, who propagated it. It is propagated as other dogwoods are—by budding or grafting, and also from seeds. Although but a variety, its seedlings have been found to come true to type. It may not be that all would be true that might come from a large sowing, as in all cases of sowing seeds of varieties there are some plants that lose the varietal character to some extent. Seeds of it and of the common dogwood grow very well sown in Spring if they have been kept in moist soil all Winter.

JOSEPH MEEHAN.

The Millionaire Strawberry.

Our illustration represents a partial view of the strawberry patch of Henry Jeroloman, the well-known New

Photo. by Professor Johnson Inspecting the Millionaire Strawberry at Hilton, N. J.

meantime examining them once or twice to see no mould generates and spreads. At the end of the two weeks, sift the seeds from the sand and then wash them free of pulp, which it will be no trouble to do if the seeds are rubbed over a fine sieve or even over a board. When thoroughly cleaned of pulp and dried for a day, mix them again with sifted sand; but an equal quantity of sand and seed will suffice. This sand must be kept slightly moist through the Winter. The box containing the seeds must be kept in a cool place all Winter—where it is neither hot nor cold is the best place—and the seeds sown in the fall have the opportunity in Spring when the ground is fit for it.

When it is a question of but a few seeds, sow them in boxes in a greenhouse, in late February or early March, and every seed may be looked for to grow.

Occasionally success follows the sowing of the seeds outdoors in Autumn, but the Spring sowing is the surer way.

Weeping Dogwood.

There is something in the habit of growth of the weeping dogwood so different from all other weeping trees that makes it sought after for positions calling for a particular kind of weeper. It differs radically from almost all other weepers in having a central shoot, always, which advances upward in a straight line, making its drooping side branches as it ascends. There are but few weepers that do this. Wier's maple does it to some extent, but there is mostly more than one shoot leading. Cut-leaved birch approaches it closely, but, as a rule the great number of the various weeping trees make no leaders, but extend in a horizontal or a downward way.

It has been said that the weeping dogwood is one of a few weeping trees that look better in Winter than in Summer. While not saying that it looks better

Jersey grower of this fruit, planted with his new variety, "The Millionaire." Mr. Jeroloman is the gentleman seen on the left of the picture, his companion being our good friend Patrick O'Mara of Peter Henderson & Company, New York.

Regarding the Millionaire strawberry Mr. O'Mara writes:

"I am free to say that from the present outlook it is easily the best strawberry now in sight. I am quite carried away with it, as it is a most prolific bearer, splendid fruit, superb color, fine flavor, and I think will outrank anything that we have at the present time."

Commenting on this strawberry in a recent number of the Rural New Yorker, a correspondent says the variety was produced by Mr. Jeroloman as a seedling five years ago. This year the finest of the crop was wholesaled in New York at forty cents a quart. "The fruit illustrated was two inches in diameter and about as large as any seen. Many run from 1 1/4 to 1 1/2 inch. The shape is uniform, no coxcombing being noted; color bright red, with a fine gloss; quality good, above the average to my taste. Its season is long and nearly every berry is matured. Foliage is strong and abundant, the plants standing from 10 to 15 inches high by actual measurement. Mr. Jeroloman has the variety scattered all about his place, here and there part of a row, in order to test it beside such standards as William Belt, Glen Mary, Bubach, etc., and it appeared to stand the blistering heat of the past trying week best of all. From the above description it might seem all known good qualities are claimed for this berry, and, indeed, as shown by Mr. Jeroloman, it is on the top notch. Just what it will do in other localities and under other conditions can be learned only by careful test. It is not in commerce and Mr. Jeroloman has no plants for sale at present."

ROSES

Planting should not be delayed any longer, and old plants to be carried over should also not much later than this be looked after and prepared for the coming season, as recommended in this column some time ago. The houses already planted should be gone over at least once a week and the surface of the benches scratched to keep down weeds and facilitate watering, which in the case of newly benched stock consists of merely watering the balls of the plants. Where a crust is allowed to form this, of course, becomes impossible, as the water usually goes everywhere else. There need be no haste to stake and tie Bride and Bridesmaid, but other varieties, especially American Beauty, should soon have supports, in order to afford a better chance to keep the plants clear of red spider; for if this pest obtains a foothold now, it is rather difficult to eradicate it later in the season, without danger of black spot. When scratching the beds of this rose, all foliage touching the soil should be removed even if green and healthy, as this is an excellent harbor for green fly and red spider. Of course, where the plants are small this cannot be done until some growth has been made, otherwise the plants will receive a severe check.

Keep all the buds pinched off when of the size of a pea, as the plants will be in much better shape for their Winter work if kept disbudded. But do not allow the buds to get full blown just because you are not shipping. There is nothing more unsightly and untidy in a rose house than to have a lot of over-blown flowers lying around, as is quite frequently seen on some even modern places.

As soon as possible clean out everything under the benches, even if this has been done at planting time; litter under the benches forms a rendezvous for vermin of all kinds. A little sand from the old propagating bed, or finely sifted ashes, should be put on the lower walks, for as a lot of water must be used the walks soon get green and slimy, and there is nothing more provoking or dangerous to a man syringing with any pressure than these same slippery walks.

Watch out for green fly, and fumigate at every opportunity when the temperature is below 65 or 70 degrees. Tobacco stems, if fresh, are the cheapest at this time of the year, as there are no buds to be injured by smoke.

We have noticed this season a new pest; it is a small worm which finds its way into the heart of a young shoot eating out the pith and thus destroying it entirely. Fortunately only a few have thus far appeared. The remedy to be used is hard to determine as yet.

Continental Novelties.

MARGUERITE BEAUTY OF NICE.—In this fine yellow variety we possess one very free in flowering, fifty or more blooms being found on a plant at the beginning of November, the weather being fine and favorable. This Marguerite is a variety of Chrysanthemum frutescens.

A YELLOW MME. LAMBAUD ROSE.—This variety of a yellow tint is a sport that appeared with M. A. Chalmers at Peabery. The form is that of the type, but the color is that of Mme. Falcot, changing to that of Mme. Chedane Quinoiseau with age.—P. L., in Rosen-Zeitung.

THE AMERICAN CARNATION IN SWABIA.—The cultivation of the American varieties of the carnation is being taken up in Germany with all earnestness, and with so much success that the trade hitherto done with the foreigner will show a considerable reduction in volume. The newest competitor in this field of commercial gardening is Hrn. G. Staehle, Court purveyor in Ludwigsburg, who has erected several ranges of span-roofed houses in which the cultivation of the plants will be carried on according to American methods.

A PROMISING ROSA CANINA AS ROSE STOCK.—To the right hand of the entrance to the rose exhibition at Mannheim, there stands in Hrn. P. Lambert's collection of roses, a wilding rose, that deserves the particular notice of the visitor. The raiser is the Court florist, Hrn. F. Grimm, of Weimar. The stems are 3.40 m., 2.80 m., 2.50 m. in length, almost destitute of prickles, straight and strong, 1.1-2 to 2.1-2 cm. in diameter, and of a brownish red tint on the sunny side. According to the statement of the raiser the whole of the plants were obtained from seeds furnished by one solitary plant.

MAURANDIA ALBA GRANDIFLORA.—M. Herb, seedsman and hybridizer, of Naples, has succeeded in raising a race of maurandia with blooms much larger than those of the old species. In recent years he was enabled to introduce the large flowered varieties, M. rosea and M. atrocaerulea grandiflora, and last year M. alba grandiflora, raised from, as we assume, M. Barclayana alba. This new variety is a stronger grower than the type form of M. alba, and likewise more floriferous, and the plant is well adapted for a variety of purposes in greenhouses and the open ground during the Summer months.

A NOVELTY IN CABBAGE LETTUCE.—Cultivators are notoriously suspicious of novelties in salad plants, as in other vegetable productions, but the variety of cabbage lettuce Rubm von Frankfurt's according to a writer in Moellers' Deutsche Gartner-Zeitung, is a great acquisition for cultivation in frames for early work, and the price it fetches in the market per head is nearly double that of any other variety, viz.: 13-14 pf. In firmness it excels many of the later varieties. It is a great advantage that it can be grown under the same degree of warmth as that afforded cucumbers and melons, and with as little ventilation as those plants. It makes good firm heads even when it is planted at the front part of the frames. Unlike other varieties the heads have so much solidity that it is unnecessary, in order to allow the flower shoots to free themselves, to cut them open. This makes seed saving a work of some expense, but it is well repaid by the price obtained for the seeds and plants. The raiser, Hrn. Todeskino, of Frankfurt-on-Main, has decided to put this variety into commerce shortly.—Horticultural Trade Journal.

Indianapolis.

News Topics.

The Indiana State Fair premium list just received does not provide for the many classes of former years. Those remaining, however, are heavier. The amount offered about equals that of 1906.

Heller Brothers of Newcastle have a new salmon pink rose which is an excellent keeper. It resembles Perle des Jardins in many points.

Henry Rieman, who has been on the sick list, is improving rapidly.

Bert Eschner invites all his florist friends to a smoke while in Philadelphia. He states that elaborate preparations are being made 'neath Mr. Rice's office desk, and time is no object.

John Rneheid has discontinued his florist establishment.

Fred. Huckleide leaves next week on a pleasure jaunt to Detroit and vicinity.

Visitors: Paul O. Beyer and family, South Bend, Ind.; Wilbur Byers, Franklin, Ind., and Mr. Cohen with Wertheimer Brothers, New York. I. B.

Herbaceous Border Notes.

About this season the dryness of Midsummer will have been making its effects felt in the border, but if the border has been properly prepared there is no time that this fact will be more apparent than the present. A deep loam well enriched by manure is better for keeping plants in growing healthy condition during the dry weather of July and August than all the watering that continuous sprinkling will give. Now here is the point, if your border has not been subsoiled the next time you are to replant it, thoroughly subsoil it and do not be afraid to use plenty of manure. This is what tells in keeping a rich dark green foliage on the plants in Midsummer.

The most showy plants at the present time are the Japanese irises. As I have before said these are the best of all the irises and they are gorgeous. There is a great variety of names and colors among them, but these Japanese names do not count for much anyway. A good way to grow these irises is to have them by the edge of a pond, or if you do not have a pond try and have them growing in water all the time. The flowers will be much larger grown this way.

Speaking of ponds a fine subject for planting on the edges is *Lythrum salicaria*. It is now very showy with its bright purple flowers. There is a finer colored variety which we know as *atro-purpurea* and which also is a good border plant. Some of the senecios are very suitable for this kind of planting. There is a variety of recent introduction which is now very fine with its large leaves and yellow, daisy-shaped flowers. I refer to *Senecio clivorum*, but there is another variety, *japonicus*, which grows to a height of four feet, that is also good, especially as the leaves are much divided and entirely distinct from those of the first named sort.

Cimicifuga racemosa is a very showy plant at present with its fine spikes of white flowers rising to a height of four or five feet. There are many plants in bloom at present with daisy-shaped flowers but none more handsome than *Echinacea purpurea*, the purple cone-flower. This plant has just started to bloom and it will continue throwing spikes of flower till frost. There are several varieties of this plant; the finest we have is known as *rosea elegans*. The Shasta daisies are in full flower, but they are little or no better than many forms of *Chrysanthemum maximum*.

Inula salicina and *Inula Royleana* are both pretty small-flowered varieties of this plant; and *Telekia cordifolia* is a plant, very much resembling some of the inulas, which is quite imposing. Several of the anemones are in full flower, tinctoria is the best known variety, but catula and altissima are both good and worth growing.

Many of the coreopsis have begun to flower; the most useful variety is *grandiflora*, although *auriculata* is good and *verticillata* is a rather pretty dwarf variety. *Gaillardia grandiflora* continues to throw a lot of bloom. *Centaurea alata* as a border plant is imposing and fine for cutting; it grows to a height of four or five feet. *Centaurea macrocephala* is just beginning to flower; this is a very fine border plant.

Many of the achilleas are now in bloom; the most useful variety is *ptarmica* "The Pearl," which will continue to flower from now on and makes a fine plant for cutting. *Achillea millefolium rubrum* is worth growing on account of its pink colored flowers.

Onopordon Acanthium is a tall growing thistle-like plant which makes quite an addition at this season; and the globe thistles are just beginning to show their colors. *Echinops rito* is perhaps the best colored variety of these plants.

Scabiosa caucasica is a plant which is now pretty well known; it has fine blue flowers which are useful for cutting. A tall growing plant with cream colored scabious-like flowers is *Cephalaria alpina* and another pretty plant resembling scabious is *Jasione perennis*; the latter grows about a foot high and is known as the shepherd's scabious.

Lysimachia punctata is a fine variety of loosestrife which has been in bloom for some time and a variety just coming into flower is *L. clethroides*, which is quite a pretty border plant and useful for cutting.

Several of the campanulas are now in bloom. *Patula* is a very pretty variety with small bells, growing to a height of two feet. *Rapunculoides* is an awful weed where it gets a hold, yet if kept in check it makes a very pretty clump in the border.

The verbasums are imposing plants in the border, of not much use individually but some of them with branching habits are very fine; the better varieties are *olympicum*, *plumoides*, *australis*, *lagarus* and *Chaixii*. Although the flowers of these varieties are all yellow the plants vary in size and habit of growth so that each is quite distinct.

Some of the pentstemons are yet very fine, *spectabilis* having been especially so; *secundiflorus* has beautiful blue shaded flowers and *campanulatus* is another very good variety.

The veronicas still are showy; one of the best at present is *spuria* of a bright blue color. *Sibirica* is a little taller, of a pleasing shade of light blue. *Lychnis chalcedonica* is a beautiful bright scarlet flowered plant, about three feet high, which at this season of the year is very imposing. There is a double form of this and also a double white form, but they are seldom met with. *Lychnis coronaria*, or as it has been more commonly known *Agrostemma coronaria* is one of the finest border plants, about two feet high; there are both red and white varieties of it and for cutting purposes it is very useful. *Epilobium angustifolium* is pretty in the border; and some old fashioned flowers are the monardias, the variety *didyma* being the brightest colored of any and is very fine.

In old-fashioned gardens the evening primroses generally found a place. *Oenothera fruticosa* is one of the most showy; another good variety is *Youngii*. Bouncing Bet makes a pretty border plant, especially if the double form is procured. The name is *Saponaria officinalis flore pleno*. *Stachys lanata* is an old border plant and the variety *grandiflora* is very fine at present. Several of the *hemerocallis* are yet in bloom, the most conspicuous being *fulva* and its double form which is known as *Kwanso*.

Astrimeria aurantiaca, a fine plant which is now a mass of yellow flowers; and I must not forget the perennial peas, *Lathyrus latifolius* and the variety *alba*; both are now in full bloom and are splendid plants. *Physostegia virginica* and the variety *alba* are attractive subjects being very useful for cutting purposes; they are much used by florists here and get the common name of Texas heath.

Aconitum napellus in several varieties has been very pretty of late.

Acanthus longifolius is a peculiar flowered plant which makes a nice variety in the border. It is said that the leaf of this plant was always copied in ancient Roman architectural ornamentation. There are several of the *liliums* which are now very fine, but I will give a few brief remarks on them at a future date.

News Notes.

We had with us the past week Harvey E. Kidder, general manager of the Ionia Pottery Company, Ionia, Mich., calling on the different growers. B. Eschner, of M. Rice & Company, Philadelphia, also was with us telling of all the good things in store for us in his city during the S. A. F. O. H. convention.

The executive committee of the St. Louis Horticultural Society held an important meeting at the Mercantile Club rooms last Tuesday afternoon. Preparations are well in hand, and it is the intention of the society to hold its Fall show in the new Coliseum, if completed in time, which is hardly possible now as work has not yet commenced, so the hall subject is again a hard problem to solve. The preliminary list has been out for some time, and copies can be had by addressing Otto G. Koenig, 6473 Florissant avenue.

Mrs. W. F. Reitzen was severely injured while driving in Forest Park the past week. The horse became frightened and she was thrown to the ground, her right collar bone being broken. She is the wife of one of our prominent commission men, who reports that she is recovering nicely.

Henry Ostertag, in company with John Burke and George Angermuller, is spending a week fishing on the St. Louis River; they have promised the boys a fish fry when they return.

The Louisiana Purchase Exposition Company will this week turn over the ground occupied by them to the Park Department. Restoration was completed the past week.

Fred Foster of the Foster Floral Company, who bought a new house in Kinloch Park, is moving into it this week. Mr. Foster reports that he will erect by this Fall a greenhouse and grow violets for his own use.

Mr. and Mrs. Edward Kalish have left for an extended tour North for a few months to escape the hot weather.

Robert Thompson, our local greenhouse builder, is kept very busy this Summer erecting new houses for the growers on the outskirts of the city.

The eighteenth annual banquet to gardeners, florists and nurserymen, provided for in the will of Henry Shaw, will be given at the Southern Hotel, Wednesday evening, August 14, 1907, at 7 o'clock.

The St. Louis Florists' Club has made special arrangements for transportation to Philadelphia to the S. A. F. O. H. convention, via Pennsylvania R. R. The round trip rate will not exceed \$25. A special car has been arranged for, and berths may now be reserved by addressing W. C. Young, 5512 Waterman avenue. The sleeping car fare is \$2.50 each way. All in the trade, who wish to do so, are cordially invited to travel from St. Louis with this party. It is expected that some of the Western delegates will travel on the same train from St. Louis on. The St. Louis delegation promises to be a large one and a pleasant time is assured. State Vice-President W. C. Young of the S. A. F. O. H. has a way of entertaining in home-like fashion, so any local or out-of-town florist who has any intention of going with us should let Mr. Young know at once.

TRANSACTIONS OF THE MASSACHUSETTS HORTICULTURAL SOCIETY FOR 1906; PART II.

This document is devoted largely to reports of the various committees of the organization, and, as usual, is most interesting. We are pleased to note the more hopeful tone of the report of Chairman Fewkes, of the Committee on Plants and Flowers, regarding the 1906 exhibitions of the society. He says the shows last year were of unusual interest, "owing largely to the meeting with us of three national associations: the American Carnation Society in January, the American Rose Society in March, and the American Peony Society in June." Mr. Fewkes adds: "It seems to us that the policy of encouraging such societies to meet here and to hold their exhibitions in conjunction with our own is a commendable one and should be adopted as often as circumstances will permit, for it brings in many exhibitors and exhibits which we would get in no other way. It not only increases the size of our exhibitions but creates a wider public interest in them as well." An increase in both exhibitors and exhibits generally during the year is recorded, and the committee feels that there has been a revival of interest in many lines. "It is true that in the classes mentioned last year as falling behind there has been no appreciable improvement, but in the classes which appeal most strongly to the unprofessional grower there has been considerable improvement."

Referring to the rose exhibits the report calls attention to the advance made in the number of varieties now available for commercial purposes, and states that Bon Silene and Safrano are still grown for market and exhibition along with their more pretentious rivals, adding that "Dame Fashion seems to be getting into a more sane mood and is recognizing beauty in many varieties, and questions not whether they are old or new, only demanding that they be obtainable in unlimited quantities and of fine quality."

During the year the total value of all awards made, in money prizes, gratuities and medals, was \$3,694.

The report is rich and valuable in its enumeration and descriptions of the new plants and flowers exhibited last year before the society, which were deemed worthy of recognition by the organization.

The Superintendent of New York Parks.

The daily press of New York City announced the past week the removal by the Park Commissioner of Manhattan of the park superintendent, "for the good of the service." It is also stated that the deposed superintendent received his appointment through the influence of a prominent politician, and that "there have been many complaints recently about the condition of Central Park." The City Club has taken up the matter, is urging the employment of a qualified landscape gardener as superintendent of parks, and has recommended an increase of salary for the office, naming at least \$6,000 a year instead of half that amount as at present, the object being to secure "a man of high standing in the landscape gardening profession" for the position. The work of Superintendent John MacLaren of the Golden Gate Park, San Francisco, is cited by the City Club as an example of what can be accomplished under adverse natural conditions, by a practical man in charge of a park system.

We are gratified to note this commendable action on the part of the City Club. If there is one branch of municipal operations more than any other that requires a practical knowledge of the work in hand, it is that of park superintendent. In fact, we would go further and state that the office of park commissioner should also be filled by a man who is thoroughly versed in the work he is called upon to supervise and perform. Unless these conditions are present, our parks are bound to suffer to a greater or less extent, and the object for which they were created accordingly be frustrated.

And in this respect among the larger cities of the United States, Manhattan, in recent years, seems to have been almost the only sufferer. The men in immediate charge of the parks in, say, Chicago, Boston, Philadelphia, Minneapolis, Rochester, Buffalo, Albany, Detroit and other cities, are all practical gardeners, and their labors are fraught with the greatest satisfaction. Indeed, the park commissioners of some of the cities named are also practical men in the gardening profession, (e. g., Mr. J. Northrup, seedsman, Minneapolis, and Mr. Philip Breitmeyer, florist, Detroit) a condition that makes for the best possible park systems in their respective localities that can be secured.

We would not, of course, have it understood that good work cannot be done in our parks with a practical gardener in charge and a layman as commissioner, for such an assertion would not be wholly correct, as several instances prove. Taking Prospect Park, Brooklyn, N. Y., as an example; some of the best results there were obtained under Commissioner Young. It may be remembered that at the banquet given to the American Carnation Society on the occasion of the visit of that organization to the City of Churches, when ex-Lieutenant-Governor Timothy Woodruff acted as toastmaster, that very affable gentleman informed his hearers that when he left the office of park commissioner of that Borough he did not know where the greenhouses were located. He was too busy, he said, building bicycle paths and parkways to visit these necessary adjuncts of Prospect Park. That may or may not have been a political joke; but if it was a truthful statement, it displayed an immense lack of a knowledge of the proper performance of the functions of a park commissioner. On the other hand, ex-Commissioner Young told how the construction of Seaside Park at Coney Island had been accomplished, of the bulb plantings that year in Prospect Park, and in other ways showed a commendable familiarity with the work of his office, at the same time demonstrating by his remarks his intense love of trees, shrubs and flowers and his belief in the great benefit of parks generally in the moral uplift, amelioration and delectation of the people. Men of this caliber are certainly not out of place as park commissioners; and if with them, as such, successful and satisfactory work has been done, it is reasonable to infer that better results should be forthcoming where both commissioner and superintendent have a practical knowledge of the duties each is called upon to perform.

We hope the day is not far distant when all the park systems of the country will be entirely separated from politics. Until then the public cannot look for the greatest satisfaction in the work in our parks, for no man can give the best that is in him operating under the knowledge that his position is far from being a permanent one; and frequent changes both in commissioner and superintendent are not conducive to continued betterment, but the reverse condition must thereby surely assert itself, and generally does.

There are many men engaged in the horticultural profession quite qualified to fill the position of either park commissioner or park superintendent in any city; and if adequate remuneration, especially in the case of the latter, was held forth as an inducement, and the office obtained on account of actual merit rather than through political influence, being at the same time a stable rather than a temporary one, there would not, we feel sure, be a dearth of suitable and satisfying applicants to choose from.

And in this connection, as well as for the better conducting of all park work, we believe it would tend to the welfare of the trade if those connected therewith would take a deeper interest in the matter of seeing to it that only efficient men are chosen for the offices in question, than now obtains; for it cannot be gainsaid that well kept parks and properly cared for gardens contained therein have an immense influence in moulding the public at large, so far as their gardening and effective home surrounding desires generally are concerned.

Society of American Florists and Ornamental Horticulturists.

Railroad Rates to Philadelphia Convention.

There has been considerable uncertainty regarding reduced railroad rates for all organizations, owing to the two-cent rate agitation. In quite a number of states the two-cent rate has been made a law.

I made application to the Trunk Line Association (in whose territory Philadelphia is situated) asking for a reduced rate of a fare and a third for our convention. After considerable correspondence, the Trunk Line Association granted the reduced rate and so informed the various other passenger associations. I also placed myself in communication with these associations, but up to the time of writing this letter (July 23), I have received no word from any of the associations, excepting the Central Passenger Association, and this association would not grant the reduced rate of fare and a third, although I was in personal communication with the officials.

The only concession which I could obtain from the Central Passenger Association is as follows:

They will charge a two-cent rate in all the territory under their jurisdiction, but at the same time will provide tickets, which will cover a rate of fare and a third in the territory governed by the Trunk Line Association; in other words, a ticket can be purchased in any city covered by the Central Passenger Association through to Philadelphia, but the fare will be at the rate of two cents in the territory covered by the Central Passenger Association and at the rate of fare and a third in the territory covered by the Trunk Line Association.

I would further inform you that this special concession covering the selling of a ticket through to Philadelphia is made only on the following conditions:

The Central Passenger Association will provide a supply of standard card orders. These to be furnished to me, and I will, upon application to me by our members, send such cards as may be necessary for their use.

You will understand that the reduced rate covering the selling of a through ticket to Philadelphia, can be obtained, *only* through the use of the card order, as received from me, and these card orders cannot be used by any person, except members of our society, or those attending the convention.

If you desire to travel in the territory of the Central Passenger Association—and necessarily you must go through the Trunk Line Association—be sure to obtain from me, in advance, a card order.

As I have stated to you above, I have been able to secure a concession only from the Trunk Line Association at one and one-third fare rate, and from the Central Passenger Association of a two-cent rate in their territory, with a through ticket covering the territory of the Trunk Line Association to Philadelphia. It is possible that I may hear from the other associations; and if so, I will furnish the information direct to the papers at the earliest possible moment.

I would call your attention to the reduced rates as granted by all the railroads to the Jamestown Exposition. In case concessions are not made by the other passenger associations, I would suggest that you make inquiry at the railroad office in your city as to the cheapest and best way to get to the convention, and at the same time take in the Jamestown Exposition. These special tickets will permit you to stop over in Philadelphia and New York.

P. J. HAUSWIRTH, Secretary.

Mr. Hauswirth also telegraphs us that the New England Passenger Association has granted a rate of fare and a third to the convention city. Ed. F. E.

Obituary

Henry P. Weber.

Henry P. Weber of the firm of H. Weber & Sons Company, Oakland Md., died by his own hand on the morning of Saturday, July 20, 1907. He shot himself in the left side of the head above the ear with a rifle. Death followed about five hours afterward.

The unfortunate man was 40 years old, and had been sick for a week previous. He leaves a widow and five children for whom, as well as for the other members of the family, much sympathy is felt.

Samuel Henshaw.

Samuel Henshaw, whose illness was recently reported in our columns, died at his home in West New Brighton, S. I., on Monday, July 22. Mr. Henshaw had been ailing for some time, but his condition had become such as to give hopes of his ultimate recovery. His unexpected death, therefore, falls heavily upon his family and his many friends. He was 75 years of age. Death was due to cancer of the stomach.

Mr. Henshaw was born near Manchester, England, his father being gardener at the Priory. He was brought up to his father's profession, and had to do with the growing of fine fruits and plants in the old style flue-heated houses. He subsequently held positions at Hope Hall and Walley Range, near his native place, and was under Campbell in the Manchester Botanic Gardens; later he entered into the business of landscape gardener with his father.

Mr. Henshaw came to the United States in 1868 as garden superintendent for Mr. J. Green of Staten Island. Here he remained for twenty years, and made a name for himself as a competent and skillful gardener. More recently Mr. Henshaw again turned his attention to landscape work. Among successful operations in this line carried out by him was the laying out and planting of the grounds of Vassar College, Poughkeepsie, N. Y.; parks for Wappinger's Falls, N. Y.; Gilbert College and Gilbert Home, Winsted,

The Late Samuel Henshaw

Conn.; the estate of Mrs. Eldridge at Norfolk, Conn.; and the grounds of Columbia College, New York.

When the old New York Horticultural Society was active, Mr. Henshaw was well known as a successful exhibitor at its flower shows. The deceased held the first appointment as head gardener of the Bronx Park Botanical Garden, and after leaving that position he did occasional work in the laying out of gardens and grounds around New York. Before his arrival in this country he gave much attention to forcing cucumbers; he also originated several varieties of strawberries. In England he numbered among his acquaintances such prominent men as Sir Joseph Paxton, Thomas Rivers, Donald Beaton and William and Robert Thompson.

Mr. Henshaw was a thorough plantsman, and in his passing away probably the last link connecting past and present generations of the gardening profession in this country has been removed. He was among the first to grow water lilies successfully in America, and in this branch of garden work always took a keen interest. He was well posted on all matters connected with horticulture, and his reminiscences of the trade in its early days in the United States were always instructive and interesting to listen to. He was an extensive traveler, making visits to Porto Rico, the West Indies, Europe, and several of the Southern and Pacific Coast states, the results of these visits being given in lectures before the New York Florists' Club and other societies. He was also an occasional contributor to the gardening press. His favorite hobby was the collecting of opals, of which he owned a large and varied assortment.

Mr. Henshaw was a member of the S. A. F. O. H., and at one time held the office of president of the New York Florists' Club. He was an affable, genial gentleman, well read, a splendid raconteur, and was held in the highest esteem by a large circle of friends, who mourn his departure from among us.

Besides a widow, he leaves three daughters, all of whom are married and live in Staten Island; one son, Edward, who is the manager of an estate in New York City, and one brother, who resides at Bristol,

Annual Convention Numbers

OUR issues for the 17th, 24th and 31st of August will, all of them, be particularly desirable for advertisers who wish to make a special drive on their respective commodities.

The reasons why these three numbers will be especially worth while taking extra space in are :

The issue for August 17 will be replete with information regarding the coming convention of the S. A. F. O. H., and with interesting data, carefully compiled and pictorially presented, about Philadelphia, the city where the convention is to be held.

While many advertisers prefer the issue just preceding the convention and have proved conclusively that that particular number is always prolific of business to them, the two following issues—namely, those of August 24 and 31—will be equally effective in selling goods, as they will contain a full and complete report of the proceedings, together with various interesting illustrations to be gathered during the convention.

These three issues will be read and preserved for future reference by thousands in the trade, and your advertisement in either one or all of them will be sure to sell goods.

We shall take advertisements until 12 o'clock noon on Wednesday of each of the weeks named, but prefer to have "copy" earlier if possible.

If you sell anything that a florist needs, and desire to reach the entire trade of the country, here is your opportunity.

Committee

JOSEPH HEACOCK, Chairman, Wyncote, Pa.
ROBERT KIFT, 1725 Chestnut St., Philadelphia.
GEORGE C. WATSON, Ninth & Market Sts., Philadelphia.
LEO NESSEN, 1209 Arch St., Philadelphia.

England. One of his nephews, W. Henshaw, operates a greenhouse establishment at Summit, N. J., another, A. M. Henshaw, is a wholesale commission florist at 52 West Twenty-eighth street, New York.

The interment took place Thursday, the 25th inst., in the Moravian Cemetery, Staten Island, funeral services being held the previous night at his late residence.

School Garden Work in Washington, D. C.

By B. T. Galloway

For the past five years the Department of Agriculture at Washington has been endeavoring to help the school authorities of the city in developing outdoor manual training for the children through the cultivation of the soil and the growing of plants. The Department has not found it necessary to take any special steps to promote this work. It has acted mainly in an advisory capacity and has furnished facilities which the schools themselves did not possess. It has cost the Department practically nothing to do the work, as the grounds furnished had to be cared for anyway, and the children's gardens have made them even more attractive than if they had been left to grass and shrubbery.

The Aim of the Work.

The work to me has been an experiment fraught with much interest, for it has had for its fundamental and basic idea the reaching of the child's mind through natural rather than formal methods. Our aim from the outset has been the betterment of the child, and to bring this about it was first necessary to provide teachers who would have a just appreciation of the issues involved. Fortunately for our city and the schools one was at hand who, by persistent effort and enthusiasm, has made the work a success. Miss Susan B. Sipe, of Normal School No. 1, laid the foundation for reaching the children by giving the Normal School students training in elementary agriculture and horticulture. Under Miss Sipe's guidance the students, who will eventually be teachers in the public schools, are given practical training in the handling of soil, the propagation and care of plants, the laying out of grounds, and application of this work to schoolroom studies.

There are usually a hundred or more students in the Normal, ranging in years from seventeen to twenty, and the majority of these students are girls. Twelve practice schools are connected with the Normal School, in which are 500 children from six to ten years of age. The course in gardening begins the Spring of the first year and continues during the second year. All matter taught the young ladies is adapted by them to the children of the practice schools and will be taught in their own schools after graduation.

The Phases of the Work.

This work takes on three phases—the home garden, improvement of school grounds, and the school garden of individual plots. In the early phases of the work students were given vegetable and flower seeds and told to plant them at home, according to directions. There

was no other choice, as there was not land enough connected with a school to conduct a school garden. Furthermore, there was no one in the vicinity willing

to induce to good feeling usually. A call in the ordinary sense of the word on the teacher's part might not always be received in the spirit with which it is made. The home garden solves this question. Here is work at home, belonging to the school, which the teacher must see. The children are delighted to show their work; the garden opens the home and usually the heart of the mother to the teacher. Besides the help she can give in connection with the garden, an observant, earnest teacher obtains much help for the after-treatment of her pupils.

There are other equally valuable phases of the home

SCHOOL GARDENS.—There is no greater pleasure than the feeling of proprietorship in a piece of ground

to allow the use of a lot, nor money to put such a lot in condition could it be procured.

A question arose in regard to home planting—how the teachers would know that the instructions had been properly followed, or how a student could be shown her mistakes. There was but one answer—the gardens must be visited; and herein lies one of the great benefits of the home garden to school life. Educational writers are urging constantly a close relation between home and school. Usually the parent does not know the teacher unless he is called to school on account of a misdemeanor on the part of the pupil, and such a call is not con-

garden which have been touched upon by writers on the subject, all tending toward the building of character; the binding of the child to the home; the cultivation of industrious habits in Summer, when children have so much idle time; the feeling of ownership; the protection of one's rights, and so the respect of others' rights. The interest aroused in other members of the family, and not infrequently in an entire neighborhood, is of importance.

During Summer Vacation.

During the Summer the garden work is continued as a vacation school. A large majority of the children keep their plots. In conducting the garden as a vacation school a fixed program is followed. This is a necessity, in order to promote habits of industry. Miss Sipe, in her notes furnished on the subject, lays out the usual plan, viz., one hour and a quarter for weeding, cultivating, and replanting the individual plots; a half hour for lessons on special crops; and a half hour for play while the remainder of the morning is devoted to the care of the general plots. These plots are the ones known as observation plots. The common grains—rye, wheat, oats, barley—fiber plant, cotton, flax, hemp and some common local products, peanuts, tobacco, cabbage, potatoes, and cowpeas are planted as a basis for practical studies in commercial geography.

The Lessons Learned.

One of the most difficult lessons to teach, and for children to learn, is that of altruism. Few of them realize the necessity of working for the good of the community: they work well when they work for themselves. The half-hour spent daily in weeding and cultivating the general plots and in cleaning paths presents an opportunity to teach good citizenship.

The lessons derived from the observation plots include methods of raising crops on a large scale; methods of harvesting; areas of greatest production and the centers of trade resulting; and the economic importance of the crops to man, including not only the products but the by-products. Taking corn for example, the children study the different parts of the plant—the roots, kinds of roots, stalk and value of the same, the leaves, methods of veining as a protection against tearing, the

SCHOOL GARDENS.—Competition in the care of plots is wholesome

sheath, the flowers, the enemies of corn, such as corn smut, corn worm, and cutworm; harvesting, by hand and by machinery; methods of husking; harvest festivals of the Indians; the corn belt of the United States; other industries in the belt due to corn growing; the centers of the corn trade on the Atlantic coast, Lake region, and Gulf coast; uses of the corn plant—stalks, leaves, cobs, and kernel; corn historically considered; how it was discovered and when; its use by the Indians; stories and poems about corn, etc. Other crops are taken up in much the same way.

The Harvest and Practical Results.

Miss Sipe states that despite the fact that last season was very unfavorable there were grown on the small plots in the Department grounds 25 bushels of tomatoes, 5,600 radishes, 6,000 heads of lettuce, 646 onions, 1,200 beets, 357 quarts of string beans, and large quantities of flowers.

Other lines of work have had for their object the beautification and improvement of school grounds, also the beautification and improvement of home grounds, in accordance with definite plans worked out by the teachers and children. A small portion of the garden has been used also for the purpose of demonstrations in practical farm management. This work was suggested by the Assistant Secretary, Professor Hays, and series of small farms, with definite rotations, were laid out and are being developed. A truck farm, a dairy farm, and a general grain farm have been planted and the regular rotations followed.

The pictures accompanying this short note speak for themselves and emphasize a fact which no one who studies the work will fail to recognize, namely, that the children's interest can be held and that both mind and body receive a training which will last through life.

The Use of Anesthetics in the Forcing of Plants.

The use of anesthetics as an aid in the forcing of flowering shrubs, tuberous and bulbous plants, and herbaceous perennials, has not as yet assumed any commercial importance among growers in this country. In Germany and France, however, anesthetics are now used quite extensively in many of the large commercial establishments. Their use at the present time is almost wholly confined to flowering shrubs, such as lilacs, viburnums, deutzias, spireas, azaleas, etc.

Although it has been known since 1878 that the effect of anesthetics on the protoplasm of plants was similar to that upon animals in so far as it rendered both insensible to external excitation, it was not known until some years later that under certain conditions its after effect upon plants was in the nature of a powerful stimulus to growth. For the discovery of this reactionary influence of anesthetics upon plants we are indebted to Dr. W. Johannsen of the Royal Danish School of Copenhagen, whose experimental studies upon the anesthetic influence of ether and chloroform upon plants, with relation to acceleration of growth, were first begun in 1890.

Willows and bulbous plants were used in the earlier experiments followed by lilacs, viburnums, azaleas, deutzias, and other ligneous plants in later studies. The results obtained by Johannsen have been amply confirmed and in many cases enlarged upon by subsequent investigators, among whom may be mentioned Lemoine, Maumene, Aymard, Ledien, Harms, Beltz and others.

Theoretic Effect of Anesthetics.

It is generally accepted at the present time that the action of ether or chloroform upon plants in the early stages of rest or the resting period, is of the nature of an arrest, or complete cessation of growth, and that as a result of this intensified suspension of all activity on the part of the plant, the usual or normal resting period is greatly abridged and the plant is at once thrown into growth when subjected to suitable conditions of temperature, moisture and light.

Maumene says "The cause of the action of anesthetics on plants is a matter of theory and may be due to an acceleration of the order of growth, or the phenomena may be the suspension of an arrest which has occurred in the natural growth. On the other hand ether or chloroform may be merely an excitant. The vapors of ether and chloroform only have a momentary effect although they produce extreme stimulation, shorten the period of repose and inaugurate

SCHOOL GARDENS

- 1.—Spring work on the school house lawn
- 2 and 3.—Improving backyards of the homes
- 3.—Reward of a Summer's work in improving school gardens

vegetation." Beltz believes that "ether or chloroform occasion an extension of the plant-cells through exterior excitation." This extension produces an enlargement of the cell capacity in the same manner as that produced on plants by the sun in Springtime. Drude, Ledien and Naumann believe that ether or chloroform checks some of the changes within the plant-cell while at the same time increasing respiration. Aymard is of the belief that anesthetics act on

vegetable tissue as dehydrating agents. In proof of this statement he found that lily-of-the-valley pips placed under a belljar with phosphoric anhydrid forced even more quickly than when treated with ether vapor. "Anesthetics produce the same effect upon vegetation as drought or freezing."

Application of Anesthetics.

The kind of plants which lend themselves most readily to anesthetic influences are for the most part flowering shrubs such as lilacs, deutzias, spireas, viburnums, and azaleas. This class of plants come into bloom early in the Spring and complete their growth at a comparatively early date and then pass into a state of rest. This condition in plants Johannsen divides into three periods which he appropriately terms early rest, middle rest, and after rest. The normal early rest period of the lilac is thought to be from June to August, the middle rest September and October, and the after rest from November to opening of Spring season. It necessarily follows that any arbitrary division of this sort must be governed by the climatic conditions prevailing in any given place and season.

Normally plants will not start into growth until they have entered into the after rest period. The largest measure of success, therefore, in the use of anesthetics must necessarily come from plants subjected to the influence of ether or chloroform during the early or middle rest period. Of these two periods the latter seems the most propitious.

The process of treatment is a comparatively simple one. Plants which are either dormant or are entering into the stage of dormancy are subjected to the vapor of ether or chloroform in an air-tight room or receptacle for from 25 to 72 hours, depending upon the earliness or lateness of the treatment and the temperature. Owing to the great density of the ether fumes the anesthetic used should be poured through an opening in the top of the receptacle into an open vessel suspended beneath.

The amount of ether or chloroform to use per cubic foot of air space should be largely governed by the temperature, moisture, season of the year and kind of plant treated. The higher the temperature and the later the season the more violent is the effect of the anesthetic; hence the amount and time of exposure to ether or chloroform may be said to vary inversely with the temperature and the season when treatment is given.

Considerable variation occurs in the amounts recommended by different writers on the subject. Johannsen (loc. cit.) advises the use of the following number of cubic centimeters of ether per 40 gallons of air space (approximately 6.2 cu. ft.):

Azaleas, 49-56 cc.; Viburnum opulus, 53-59 cc.; Amygdalus persica, and Prunus triloba, 42-53 cc.; spireas, 45-53 cc.; Deutzia gracilis, 49-56 cc.; lilacs, 42-56 cc.

Drude, Ledien and Naumann recommend as a normal dose during October 50 to 60 grams of ether per hectoliter of air space (approximately 3.5 cu. ft.). The normal dose for November is claimed to be 40 grams (57 cc.), but during the latter part of the month even this amount is thought to be too great. In October 48 hours treatment is recommended while toward the close of the rest period 24 hours may be sufficient. "Plants were killed when subjected to 40 grams of ether per hectoliter for four days. When 60 grams were used the plants were killed in two days." Quite as much variation has been noted in the amounts recommended by other writers as in the two just noted. Apparently there is greater latitude in the amount of ether or chloroform vapor that plants will stand than is currently believed by those who have practiced its use. When chloroform is substituted for ether only about one-third to one-fourth the amount should be used, as its action upon the plant is much more intense.

Approximate Growth Acceleration of Treated Plants.

The relative increase in earliness of blooming period of treated over untreated plants varies inversely to the earliness or lateness of the forcing period. Drude, Ledien and Naumann (loc. cit.) claim that growth is hastened about a month by treatment. On an average a gain of from 10-15 days may be expected. In addition to gain in earliness, however, there is a considerable increase in the amount of bloom obtained from treated plants.—William Stuart in Annual Report of Vermont Agricultural Experiment Station.

"THE BLISTER MITE AND ITS ALLIES" is dealt with in Bulletin 283 of the New York Agricultural Experiment Station, Geneva. It is designated "a new apple pest." Directions are given for the control of the pest.

Some Diseases and Insects.

Bacteriosis of Geraniums.

In a previous publication of this station a short note was made of a bacterial disease of geraniums occurring in this State. (Tenth annual report, Hatch Experiment Station, 1898, page 67.) Since that time we have made yearly observations on the prevalence of this disease in various sections. It has appeared every year since it was first noted here in 1898, and has also been reported from various other sections of the United States within recent years.

Our observations have shown that it has frequently been abundant and generally distributed, so much so at times that gardeners have been more or less concerned about it. We have also noticed this disease in greenhouses each year, it having apparently been brought in with out-door stock, although it does not appear to be serious under glass. Our observations have shown that the trouble is more frequently found on plants exposed to bright sunshine than on those growing in shade, and is evidently more severe farther south, where the light is more intense than in Massachusetts. Geraniums require comparatively little light for their best development, and a strong light may favor the development of this disease.

The disease affects the leaves, causing spots to appear on them. The spots are often numerous and sometimes coalesce, which causes the diseased por-

AN ENEMY OF POPLARS AND WILLOWS.—Bulletin 286 of the New York Experiment Station, Geneva, deals with a horer, the larva of a curculio, *Cryptorhynchus lapathi*, that injures poplar and willows both in the nursery and as mature trees. The beetle is dull black in color but marked with whitish scales on the rear third of the wing covers, on part of the thighs and beneath the front part of the body. These collections of scales give the appearance of whitish spots or bands on these parts of the insect. Practically all the beetles will have emerged by the last of July, so they are most numerous during this month and August; but all do not die until well along in the Fall. They are voracious feeders, puncturing the bark in numerous places and eating the tender tissue beneath.

The station recommends, experimentally, the treatment of poplar and willow trees, in nurseries in localities where the beetles are abundant, with a poison spray. The poison should be combined with Bordeaux mixture as such a combination will protect the trees against many fungous diseases and various other insects. An application of such a mixture of Bordeaux with 3 pounds of arsenate of lead to each 50 gallon can be made on nursery blocks of two-year-old poplars at an expense of one-fourth of a cent a tree. The application should be made about July 15, since the beetles are most numerous after that time. As further remedial measures, new blocks of poplar and willow should be set at some considerable distance, say one hundred yards, away from

CLUB AND SOCIETY DOINGS.

CANADIAN HORTICULTURAL ASSOCIATION.—The tenth annual convention of this organization will be held in the Board of Trade Building, London, Ont., August 28 and 29 next. The program will be issued shortly by Secretary A. H. Ewing, Woodstock, Ont. Among papers to be presented will be one on "Up-to-date Retail Store Management," by Mr. Brown of the J. H. Dunlop establishment; another on "How to Make a Flower Show More Attractive to the General Public and of Most Benefit to the Trade," will be read by Charles Chambers, secretary-treasurer of the Toronto Horticulture Society. Other papers of an equally interesting nature will be read.

THE SOCIETY FOR HORTICULTURAL SCIENCE will hold its fifth meeting at the Jamestown Exposition in connection with the thirty-first biennial meeting of the American Pomological Society, September 24, 25, 26, 1907. Arrangements have not yet been made as to the time of sessions, but the three days' meeting will give ample time for the programs of the two societies. The Inside Inn on the Exposition grounds is to be headquarters for the American Pomological Society and since most of the members of the Society for Horticultural Science belong to the older association, arrangements have not been made for separate headquarters. The single topic of plant breeding will be discussed and the program committee promises papers and addresses of merit. The rates to the Exposition are low and the routes varied. The Exposition will have attractions for all. The several advantages attending the fifth annual meeting of the society should insure a large attendance.

U. P. HEDRICK, Assistant Secretary.

MASSACHUSETTS HORTICULTURAL SOCIETY.—The committee on gardens of the Massachusetts Horticultural Society invites the attention of owners of estates in Massachusetts to the premiums offered by the society for the encouragement of the horticultural development of private grounds.

There is an impression abroad that these premiums are intended only for large estates, but in recent years the committee has so arranged the schedule that all classes of private gardens and grounds are eligible, as the following list of prizes offered will show.

The H. H. Hunnewell Triennial Premium of two prizes, \$160 and \$80, is offered for an estate of three acres or more, and special prizes of \$50 and \$25 are offered for an estate of from one to three acres.

For still smaller places of from five thousand to twenty thousand square feet two prizes, the first a silver medal and \$10 and a second of \$10, are offered for the best flower garden and also for the best vegetable garden.

For the best garden of hardy roses are offered two prizes of \$30 and \$20, and the same is offered for the best peony garden.

Entries can be made at any time during the season up to September 15, excepting in the rose and peony classes, which, of course, must be visited when in flower.

In making examinations of smaller estates and gardens the committee pays a good deal of attention to tasteful arrangement and to the general economy and thrift displayed, especially in regard to the neatness of the grounds.

The committee this year is composed of Charles W. Parker, chairman Oakes Ames, George Barker, Wm. N. Craig, Wm. H. Elliott, A. F. Estabrook, A. H. Fewkes, J. A. Pettigrew, W. W. Rawson, Wm. P. Rich, H. P. Walcott, and S. M. Weld.

WM. P. RICH, Secretary.

Ladies' Auxiliary S. A. F. O. H.

The secretary of the Ladies' Auxiliary of the S. A. F. O. H. would be pleased to register as many members and send pins to as many as possible before the date of the convention. These pins will enable members to identify each other quickly. Address Mrs. Chas. H. Maynard, 219 Horton avenue, Detroit, Mich.

Agricultural Advertising in its July, 1907, issue gives a list of publications devoted to farming in its various departments, date when established, and claimed circulation, among them three of the florists' trade papers. The data, it is stated, was compiled early in June of the present year. In that list we note the circulation of The Florists' Review is given as 6,100, just 1,000 less than our own. This hardly harmonizes with the "claimed" circulation of our esteemed contemporary, as set forth in its July 4, 1907, number, which was therein stated to be 8,000. The latter statement and the one regarding the circulation of our other Chicago contemporary, given in the list referred to, shows that to "claim" circulation figures is the easiest thing in the world.

SCHOOL GARDENS.—The best time of all is the harvest time

tions to dry up and turn brown. The spots are about one-eighth of an inch in diameter, and resemble blisters. No other portion of the plant is affected. Examination of a large number of diseased sections shows only a few bacteria present in the tissues, except in those cells bordering on the outer portions of the spots.

The geranium is a very hardy plant, and one of the freest from disease. No attempt has been made to treat this disease, to our knowledge, and should it become more troublesome some remedy for it will have to be discovered.—Massachusetts Agricultural Experiment Station.

VIOLET LEAF SPOT.—A new violet leaf spot disease (*Marsonia violae*) is reported by the Vermont Agricultural Experiment Station, specimens having been received there for identification. This disease may have been imported originally from Europe, since it has been known there for some time, but has only recently been seen in this country. The disease is characterized by numerous small, raised spots, black or brown in color, and occurring mostly upon the upper surface of the leaf. These little pustules, the acervuli, contain some curved two-celled spores averaging about 16 microns long by 5.5 broad. The septum is generally excentric, that is, nearer one end of the spore than the other. The disease attacks only the leaves of the plants, and is not thought to be dangerous, but it is quite evidently spreading, and should be closely watched. The only remedy known at present is to keep the beds as free as possible from diseased leaves and plants.

blocks of old trees. Nurserymen should, as far as practicable, dispose of stock before it is three years old, as the infestation is liable to gain very rapidly in the second and third years. Badly injured or unsalable trees and brush left from pruning should be removed and burned, as should also any infested willows along creeks, ditches or swampy places near the nurseries, as these make excellent breeding grounds for the pest.

When a few trees or a plantation is slightly infested, the infested trees or branches should be removed and burned in June, before the beetles emerge.

If willows or poplars planted for windbreaks, or screens, or holders of the soil, should become so badly injured as to impair their beauty, it is advisable to dig out and burn the infested trees during the Winter or Spring, and to replant with some other kind of a tree. The silver maple and Wier's cut-leaved maple are recommended for this purpose, as they are said to grow well in damp localities.

AN APOSTROPHE TO THE PEONY.—The peony stands at the forefront of all garden flowers. When its merits and economic value are properly known it will be one of the most demandable of all plants. In many ways it excels the rose. Its surety, majesticalness, ease of culture, freedom from disease, make for its popularity. Many wonder why we are so enthusiastic over peonies. When they see our fields, the appreciation of perfection, they speak for themselves in eloquence, language, beauty or in a decisiveness no human can equal. Our fields during the blooming season were a paradise of beauty, perfume and achievement.—From Price List of C. Betscher, Canal Dover, O.

FOR THE RETAILER

For reproduction on this page, we solicit from our readers engaged in the Retail Trade, good, clear photographs of subjects that are of general interest, such as store interiors, designs of different classes, new delivery wagons, etc.

The Work of the Week.

The past week has been a very busy one with funeral orders. Some high class work calling for orchids, lily of the valley, etc., has helped to bring the supply of these commodities down to normal conditions. We expect to hear about sweet peas and flowers of that grade being given to the "ash man," but when it comes to orchids going the same way, we begin to hope for better things. These have come at last and with the improved conditions at Newport, it is not likely they will sink to that level again—at least not till next Summer.

Orchids were a feature of the splendid array of floral tributes seen at a funeral this week. *Cattleya gigas* Gaskelliana and the diminutive *Harrisonia* were largely used. Perhaps the most attractive piece was one made as follows: It was a standing wreath, about thirty-six inches across, and mounted somewhat higher than usual. The wreath itself was filled with *Cattleya gigas*, some

Greenhouses of John Lawrance, Ogdensburg, N. Y.

of the flowers measuring nine inches across. About one hundred orchids were used. Long sprays of *Asparagus plumosus* hung from the outer edge of the wreath some of them falling two feet below, a few sprays being employed among the orchids. The standard was covered thickly with *smilax*; stalks of *Lilium candidum* were wired on to this, forming a column, the base being done with *Lilium Harrisii*. The contrast of the two varieties was very striking. No ribbon was employed on the wreath, but a beautiful bow of orchid ribbon was tied half way up the column, the ends falling gracefully to the lilies below.

American Beauty roses with *Bouvardia Humboldtii* were used in another wreath, the roses prevailing, with a large spray cluster of *bouvardia* and maidenhair fern. The *bouvardia* held up remarkably well and proved a most pleasing change from lily of the valley.

A large imperial wreath was made with American Beauty roses in a cluster filled in with leaves of *Dracaena amabilis*. The effect was odd, but not particularly pleasing in results, as the leaves were too large and rather overshadowed the flowers. They could, however, be used with good effect for base work on standing pieces.

Another wreath that attracted attention was a sweet pea combination; white, lavender and purple were the colors employed. The foliage used for filling in was of *Pteris cretica albo-lineata* and *Pteris serrulata*. The piece had evidently been sent from some local greenhouse establishment.

The designs done in sweet peas were not entirely satisfactory; most of them were very much the worse for the warm weather. The pieces that were well filled with sweet peas looked the best, as the decayed flowers underneath were not as apparent as in the more sparsely filled designs.

A Casket Bunch Design.

The double end casket bunch is used a great deal in New York at present. It is made to lie on the top of the casket when no pall or other floral covering is employed. It is constructed the same as a double ended bunch, but both ends are alike. If lilies or other long stemmed flowers are to be used, they can be put together in the usual way; if shorter stemmed flowers are to compose the design, the simplest method is to moss up a narrow oblong plateau, such as is employed for dinner work, and stem the flowers on sticks as for any other design. *Cycas revoluta* leaves are invariably used for casket bunches to get the desired length for covering the casket.

A bunch of this description was used at the funeral referred to. It was made with lily of the valley and *Cattleya gigas*, on a plateau. A large cluster of *Cattleya gigas* occupied the center of the bunch, lily of the valley filling in the two ends, the bunch being about twenty-six inches at the widest part and tapering away to where the *cycas* leaves are inserted, three of these being used at either end, with a spray of lily of the valley running up about two-thirds of the entire length of each leaf.

A large wreath made in the European style was a decided change from the rest of the work seen at this funeral. The frame was mossed round, and entirely filled with white carnations, inserted as close to the frame as possible, producing a solid white effect. Two or three sprays of *Cattleya gigas* were arranged in a long spray, with a light sprinkling of lily of the valley and maidenhair fern.

The arrangement of the floral pieces at this funeral was quite a feature. The back of the chancel was entirely done in dark oak, and the wreaths, etc., were hung against this background to the height of fifteen feet and gradually brought down to the foot of the casket forming an immense bank of flowers the full width of the chancel. A few palms were placed on either side to relieve the set effect. D. RAYBUN.

CALLA ELLIOTTIANA FLOWERS.—We have been favored with a few blooms of *Calla Elliottiana* from John Lewis Childs, Floral Park, N. Y., and are free to confess that this variety far surpasses in beauty anything we have previously seen in the line of a yellow flowered calla. The blooms are of the size of the ordinary calla, but the coloring is a perfect yellow, that beautiful golden color so rarely seen, unless it be in some collection of stove plants where the *allamanda* is grown. The foliage is of the spotted type, and gives evidence that the plant is a vigorous one. As a commercial variety for cut flower purposes *Calla Elliottiana* should prove a winner; its bright, lively yellow color will place it in the first rank either as a cut flower, or as a flowering plant.

WHAT ROSE SOIL COSTS.—In one of the rose-growing districts adjacent to New York the florists have to pay \$150 an acre for surface soil—merely a shallow layer to use in the greenhouses. A few years ago they paid \$60 an acre for the same, but increasing demand, combined with a real estate boom, has caused the rise in prices. In some cases it is necessary for a florist to buy a farm to supply himself with soil. Modern floriculture has made us acquainted with many wonders, but we have not yet developed the possibility of growing roses without soil. We have, however, learned how to remove the surface soil and then by means of chemicals and green manures to make a new layer on top of the earth.—Rural New Yorker.

DIRECTORY OF RELIABLE RETAIL HOUSES

The retail florist firms advertising under this heading will accept and fill orders for flowers and floral designs forwarded them by mail, telegraph or telephone, the usual commission of 25 per cent. being allowed.

\$25.00, payable quarterly in advance, will entitle the advertiser to a four-line card, under this heading, for one year, 52 insertions. For every line additional to four, \$5.00 will be charged. Four lines will average 32 words; each additional line, 9 words. Each advertiser receives one copy, free, of our Florists' Telegraph Code.

New York.

YOUNG & NUGENT, 42 West 28th St. We are in the theatre district and also have exceptional facilities for delivering flowers on outgoing steamers. Wire us your orders; they will receive prompt and careful attention.

MYER, 611 Madison Ave. My facilities for delivering flowers for any and all occasions are unexcelled. Can give prompt service to steamer and theatre trade. Telegraphic orders solicited. Telephone, 5297 Plaza.

Kansas City, Mo.

SAMUEL MURRAY, 1017 Broadway. I will deliver orders for flowers in Kansas City and vicinity promptly. A first-class stock of seasonable varieties of flowers always on hand. Wire me your orders.

Washington, D. C.

GUDE BROS., 1214 F Street, N. W. We excel in high-class flowers and design work of every description; quick service, reasonable charges and liberal treatment have placed us on top. Try us.

Milwaukee, Wis.

THE C. C. POLLWORTH CO., Wholesale Florists, will take care of all your Retail orders for the delivery of flowers anywhere in Wisconsin.

Detroit, Mich.

Cincinnati, O.

HARDESTY & CO., 150 East Fourth, sell the best grade of flowers grown. Retail orders from distant points for delivery in Cincinnati or surrounding territory will receive prompt attention. Telegraph us.

Dayton, O.

W. G. MATTHEWS, FLORIST, 16 West Third Street. Flowers in any arrangement for all occasions for Dayton and vicinity. Personal attention given to all orders. Long distance telephones.

Dallas, Texas.

LANG, THE FLOREST, the largest flower store in the South. Floral designs and all flowers in season; personal supervision and prompt service in Oklahoma, Texas, Louisiana. Mail and telegraphic orders solicited.

Louisville, Ky.

JACOB SCHULZ, 644 4th Avenue. Personal attention given to out-of-town orders for Louisville and surrounding territory. Have a choice line of seasonable flowers always in stock; delivery facilities perfect.

Indianapolis, Ind.

BERTERMANN BROS. CO. Our facilities for executing orders in an efficient manner are unexcelled. Our shipping territory includes the surrounding states. High grade flowers; expert workmanship.

Albany, N. Y.

EYRES, 11 North Pearl Street, cut flowers or floral designs delivered to any part of Albany and vicinity on telegraphic order. Personal attention given and satisfaction guaranteed.

Chicago, Ill.

HAUSWIRTH, The Auditorium Florist, 232 Michigan Avenue. The quality of our work is of National repute, and we are prepared to execute commissions in first-class style in Chicago and its environs.

Retailers desiring a share of out of town trade should be represented by a card in this column.

THE WEEK'S WORK.

Timme's Timely Teachings.

Seeds and Seedlings.

Much of what florists and plantmen consider profitable stock to handle is raised from seeds, more of it now than was deemed advisable in the earlier periods of commercial gardening. Besides annuals and some of the longer lived species, which can only be perpetuated by following nature's most efficient course, the grower now raises many kinds of his stock from seeds which in years gone by were mainly grown from offsets or cuttings, such as gloxinias, cyclamens, petunias, bedding and tuberous begonias, lobelias, salvias, verbenas, etc. By so doing he materially lessens the cost of production and obtains what must be considered, in many respects, superior stock to that reared under former methods. Seedlings in every instance are not only stronger and shapelier, but also more floriferous than plants grown from cuttings, reserved corms or detached side-growth, while these latter come into bloom sooner and leave no doubt as to their character, points on their side in some cases weighty enough to deserve consideration, but more and more to be found in plants raised from the greatly improved strains of seed as now obtainable. Whatever else may have been done toward the betterment of commercial plant culture and its products, the greater caution and care as now exercised by seed grower and seed dealer proved by no means the least helpful of factors.

Thus it comes that the florist who is compelled to grow many kinds of stock for his trade is at all seasons kept fairly busy with seeds and seedlings. This subject, therefore, though usually most thoroughly canvassed in early Spring, is always a timely one and never more so than just now when the more important kinds of stock, annually grown from seeds, those requiring the greatest care, must be started or are only just above ground. Such things as are raised from seeds in early Spring under the most favorable conditions, grown rapidly into size and disposed of before the hot season sets in, give least trouble in starting; anybody with half a mind to do right can grow them. It is not so easy now. Some skill and much care are required to convert a pinch of minute seeds into a batch of sturdy seedlings at this season. The dry atmosphere and high temperature of Midsummer are against easily won success. Still, a beginning at this period of the year must be made in the growing of several kinds of stock in order to have the finished plants at a time when such stock is most likely to prove highly profitable.

In starting seeds of hardy and half hardy species at this season the following rules hold good and should be observed in every case: Though well ripened seeds of many kinds retain their vitality for years it is best to sow only strictly fresh seeds in Midsummer. Stale, kept over seeds, willingly sprouting at all other seasons, often refuse to do so in hot weather. This applies to such kinds as mignonette, pansies, sweet peas and all of the hardy herbaceous class. Digitalis, heuchera and aquilegia, sown in a frame on the fourth of August last year, did not come up and were given up by me as worthless old seeds, but all of them appeared above ground this Spring, and that too after the frame had been filled with geraniums and cleared out several times. The temperature favorable for germination can be too high as well as too low, and good seeds, escaping decay, abide their time, as is everywhere exemplified in nature's own domain.

Seed pans and seed beds at this season must therefore be kept cool, must be heavily shaded, a solid board covering being the best. Air should only be admitted at night and water only given when absolutely needful before the seeds are up. All seeds smaller than those of pansies, which must soon be sown, should not be covered with earth, while these and others still larger will sprout sooner if given a somewhat heavy covering at this season.

After the seeds are up a light shading on sunny days will still be of benefit to many kinds for the remainder of the

hot season—really the most critical period in the life of the seedlings. Primulas, cyclamens, cinerarias, caleolarias and even stocks and antirrhinums, all are easily ruined by being too freely exposed to fierce sunlight and scorching air currents, and anything too much or too little in the matter of moisture is equally baneful. It is at this time when forgetfulness on the part of the grower, in fact the slightest neglect, amounts to partial or total failure with seeds and seedlings. A timely transplanting saves many a batch of Midsummer seedlings from becoming drawn and spindly or from falling victims to threatening decay. To prick off a dense mass of tiny plantlets, barely fit to handle, is work that cannot be classed among the most agreeable or markedly expeditious operations, but as a means of lessening danger and difficulty it is the most infallible of cultural tricks.

Seed Saving.

To save seeds from flowers of exceptionally fine plants is a common practice with everyone interested in gardening, whether in the seed business or not. To it is due much of what has been accomplished toward varietal improvement based on the principle of mere selection. The first rule governing the raising of seeds, however, is to perpetuate a variety in its purity and present state of excellence; the second being just the reverse—an attempt to obtain a strain differing from the present one, something not already existing. To fail in either is nothing unusual. The grower of field crops, greenhouse and market plants, who raises much of what he requires in seeds on his own place, does so under the belief that an equally good grade of seeds cannot be obtained from any seed house, and, respecting some few kinds, he may be right. But should opportunity offer to make comparison between plants grown from purchased seeds and those raised from home saved seeds of varieties listed in every catalogue, the former usually show up better in most points which go to make fine stock than the latter. This is a common experience and the reason is easily found.

With the greatest of care in the selection of flowers for seed production, even the best strains, especially when grown on the same place, in the same soil and under the same conditions—and these not the most favorable at that—year after year, soon run out. The fine attributes possessed by a newly acquired variety of some of the more important things grown extensively by florists, actually vanish under the fingers of the seed saving home grower. Deterioration, hastened by confinement to one locality, is most rapid in pansies, asters, gloxinias, mignonette, carnations and cyclamens. A good variety of asters is hard to hold by the most circumspect saving of seeds, while, if widely distributed over the country and an interchange of seeds, grown by experts, takes place, it may last for years.

Favorable locality has all to do with the raising of good seeds, and seed firms, being well aware of this, are supplied by growers from greatly varying and widely separated sections of the globe, each one having been found to be especially suited to the raising of certain kinds of seeds. This and the greatly improved methods and appliances, as now employed in the harvesting of seeds,

afford ample assurance to the grower of his being able to procure from reputable seed dealers as good, in most cases better and at all times cheaper seeds of any of the things offered than he will ever be able to raise himself from stock growing on his own place.

While there can be no doubt as to the truth of the foregoing statements it does not call in question the wisdom or remove the necessity of saving the seeds from anything not generally grown, or, if so, much superior to what is seen of it on other places; in short, anything exceptionally fine and not to be had otherwise. A greatly differing flower or one on a plant differing from the rest in being stronger, more floriferous, flowering earlier or showing qualities not possessed by any of the others among which it was discovered, should be allowed to bear seeds and these well taken care of. Should there be more than one such plant, much or slightly varying in character, the seeds of each must be kept separate, labeled, if many, numbered and their respective characteristics briefly noted.

A rather dry season or a decrease in the usual amount of moisture as afforded by hose or watering can, and free exposure to sunlight and air, favor the ripening of seeds. If of a valuable kind the seed bearing flowers must be protected from heavy rains and strong winds. Seeds must attain maturity on the plant to be really good, not ripened after being cut off, though it may be necessary to keep close watch to prevent a loss of over-ripe seeds—always the heaviest and best—by being spilled over the ground. Plants that are apt to shed their seeds, if allowed to become thoroughly ripe, are pansies, impatiens, asters, oxalis and hardy chrysanthemums, besides many others of less importance. Of these the seed disks and pods must be cut while still somewhat green and spread out on boards or paper for the final ripening of the seeds. All kinds of seeds keep longest in a reasonably dry place after being well cured, and those saved for home use are best if left in their pods or husks and not cleaned until they are to be sown.

Large central blooms, as of chrysanthemums, pinks and asters and those on the main spike of stocks and like species, produce the most perfect seeds, these again resulting in the finest of plants, the flowers of which, however, are more inclined to show an open disk or a great percentage of singles than those on plants raised from seeds borne by smaller but more perfect side blooms.

HELP WANTED

WANTED—Married man for rose or carnation section. State wages wanted per week. Address, S. H., care The Florists' Exchange.

WANTED—At once, section man to grow roses. Must be single man. Address or call, T. W. Lydecker, 220 Grand Avenue, Englewood, N. J.

WANTED—Single man with some experience to assist in growing and bunching mostly single violets. E. Bingham, Pine street, Dedham, Mass.

WANTED—Competent assistant in flower seed and bulb department. State experience and salary wanted. Address, Schlegel & Fottler Company, Boston, Mass.

WANTED—Man to work under foreman in establishment where roses only are grown. Wages, \$56.00 per month. Address, S. W., care The Florists' Exchange.

WANTED—Night fireman with some experience in general greenhouse work. Position permanent; married man preferred; must come well recommended. Address, S. G., care The Florists' Exchange.

WANTED—A foreman, must have reference from last employer. One who understands the growing of general bedding stock, carnations, etc. Chas. Krambach, 191 35th Street, Brooklyn, N. Y.

WANTED—Young man for general greenhouse work, under foreman. Some experience in roses preferred. Married or single. Address, with references, etc., Thorn Hedge Greenhouse, Newton Square, Pa.

WANTED—Competent rose grower with some knowledge of chrysanthemums and violets, in the middle West. Married man preferred. State age, nationality, wages, etc. Address, G. H., care The Florists' Exchange.

WANTED—A foreman for greenhouses; must be a man of good habits and competent to handle plant growing and cut flower houses. 50,000 feet of glass and large mail order business. Iowa Seed Company, Des Moines, Ia.

WANTED—Young man to work in a wholesale florist's store. Quick, bright, active young man will be given favorable opportunity. State age, salary and reference. Full particulars. Address, A. Y., care The Florists' Exchange.

WANTED IN SEED STORE—Experienced man to take charge of flower seed and bulb department. A first class permanent position to right party. State experience, salary wanted and whether any experience on the road. Address, Seeds, care The Florists' Exchange.

WANTED—Man of ability to manage and look after the details of retail flower business. Must be a pusher; persistent, tenacious, thorough and systematic. Address, stating age, experience and qualifications and full particulars. Detail, care The Florists' Exchange.

WANTED—Nurseryman for general nursery work and outside work. Hollander or Frenchman preferred; must be temperate. Apply by mail at the Continental Nurseries, Franklin, Mass., stating former experience and wages expected. Steady position to the right man.

WANTED—Experienced single man for carnations and miscellaneous stock. We furnish board and room and man must positively be sober. Give references and wages expected. This position gives a good opportunity to a good man. Address, Box 437, Minersville, Pa.

SEEDSMAN.

AN up-to-date counterman, must be sober, energetic, have thorough knowledge of the seed business. A permanent place for the right man. In answering give full particulars as to experience, salary wanted and give references. Address, S. Z., care of The Florists' Exchange.

WANTED—Foreman or superintendent on one of the best known palm nurseries in Philadelphia, Pa. Must be competent, strictly temperate and of irreproachable character. Good salary and pleasant position to right man. An excellent record required. Chas. D. Ball, Holmesburg, Philadelphia, Pa.

WANTED—A young man, married or single, as rose grower. The position offered is within a hundred miles of New York. A good opportunity for a man who has had several years' experience under foreman and is looking for advancement. State where last employed. Give reference. Address, K. B., care The Florists' Exchange.

WANTED—The services of a well-informed gardener of good, personal presence and fluent of speech, who has retired from active work, but is able to travel around freely to represent the advertiser and sell its books, of which we have issued some half a dozen, by experts, especially written for the gardening and florist craft. Straight commission, or would give salary and commission to a competent party. Address by letter with full particulars, Horticultural, care P. O. Box 1697, New York City.

HELP WANTED

WANTED—At once, a sober, industrious, reliable, married man, no children, for general greenhouse work, who has had experience. Chance of advancement later on if satisfactory. New dwelling house with all conveniences. State wages expected, without rent, in first letter. Address, F. B. Rine, Prop. Riverview Greenhouses, Lewisburg, Pa.

WANTED

A New York importing house wants a competent man to do the packing and shipping of bulbs, plants, etc., also act as traveling salesman if required. Only those having some knowledge of the handling of bulbs and plants need apply. State age and salary wanted. Good opportunity for the right party. Address, SEEDHOUSE, care Florist's Exchange.

STOCK FOR SALE

ROSES, Bride, Bridesmaid, Ivory, 2½ in., shifted from 2 in. \$2.00 per 100; \$25.00 per 1000. Wm. B. Sands, Lake Roland, Baltimore, Md.

CHRYSANTHEMUMS, best standard cut flower sorts, in colors to suit; 2 and 2½ in. pots, \$2.00 per 100. Cash. Ellis Brothers & Company, Keene, N. H.

PEONY FESTIVA MAXIMA and all best sorts; large stock of strong plants, 2 years old. Catalogue free. Dessert, Peony Specialist, Chenonceaux, France.

2000 Bridesmaids, 2000 Brides and 200 Richmond plants, in good shape, all in 4 in. pots, at 5c. each; in 600 lots, 4c. Cash with order. Elwood Brant, Madison, N. J.

FIRST-CLASS, field-grown Enchantress carnations, first and second sizes, \$7.00 and \$6.00 per 100; \$60.00 and \$50.00 per 1000. Wa-No-Ka Greenhouses, Barneveld, N. Y.

VIOLET PLANTS—Marie Louise, Gov. Herrick, California and Princess of Wales, strong healthy stock. Celery, Kale, Dwarf Curled Scotch. Write for prices. Frank Winterer, Roosevelt, N. Y.

SPECIAL SALE of plants. Kentias, large and small, Boxwoods, Cycas and other large ornamental plants. To realize immediately and to reduce quantity of stock, the above are offered at exceptionally low prices for cash. Correspondence solicited. J. M. Hodgson, Florist, Newport, R. I.

CHRYSANTHEMUMS, all in the best condition. 80 Alice Byron, 100 J. K. Shaw, 125 Dr. Enguehard, 60 Glory Pacific, 25 Harry Parr, in 2½ in. pots, at 2c. each. 100 Ivory, 60 Maud Dean, 25 Monrovia, in soil, at 1c. each. The lot for \$7.50 cash. Harvey B. Green, Lowell, Mass.

CELERY PLANTS—500,000 field-grown, Livingston's Snow-white, Golden Self-Blanching, Giant Pascal, Golden Heart and Perle Le Grand. To reduce surplus stock we offer subject to unsold, at \$2.00 per 1000; 10,000 or more, \$1.75 per 1000. Larger quantities, ask for price. Field-grown Cabbage and Cauliflower plants. Ask for special price list. Mention quantity needed. Livingston Seed Company, Columbus, O.

CABBAGE PLANTS, early and late, Flat Dutch, Succession, and Savoy, \$1.00 per 1000; 10,000 and over, 80c. per 1000. Celery, Golden Self Blanching, Giant Pascal, White Plume, Winter Queen, Golden Heart, \$1.00 per 1000; 10,000 and over, 80c. per 1000. Borecole, Brussels Sprouts, Leek, \$1.00 per 1000. Lettuce, Grand Rapids, Boston Market, Defiance, \$1.00 per 1000. Parsley, Moss Curled, \$1.00 per 1000. My plants are fine. Cash with order, please. Samuel W. Shanklin, White Marsh, Md.

SURPLUS STOCK, for sale or exchange, 375 Manley, 125 Enchantress, and 200 White Lawson carnations, all good, clean, strong, healthy stock from 3 in. pots, at \$5.00 per 100 or \$30.00 for the lot of 700. 900 Asparagus Plumosus Nanus, strong plants, 3 in. pots, \$6.00 per 100 or \$45.00 for the lot. 175 Asparagus Sprengeri, strong plants, 4 in. pots, \$6.00 for the lot. 100 Crowsfoot Fern, 3 in. pots, \$6.00. Lawson, Harry Penn, Manley, Queen Louise and Enchantress carnations, field-grown, fine, healthy stock, ready August 1. Cash with order. Joseph Towell, Paterson, N. J.

MISCELLANEOUS WANTS

WANTED—At once, 1,400 ft. of second-hand, 4 in., standard greenhouse pipe. Address, A. Z., care The Florists' Exchange.

WANTED—500 Vinca Variegata, in 2 or 2½ in. pots. Mrs. C. M. Hutchinson, 1216 North Broad street, Elizabeth, N. J.

MISCELLANEOUS WANTS

WANTED TO BUY—Greenhouses to be taken down. State full particulars of same when writing. Address, F. W., care The Florists' Exchange.

WANTED—Partner to take interest in a modern greenhouse establishment of about 100 thousand square feet of glass. Must be able to invest from twenty to twenty-five thousand dollars. Correspondents must give some assurance of their reliability and business standing to insure prompt reply. Address, B. C., care The Florists' Exchange.

FOR SALE OR RENT

TO RENT—At Bayside, L. I., two greenhouses, 20x200 feet, and living apartments. Address, Butler, 31 Jackson avenue, near 34th Street Ferry, Long Island City.

TO LEASE—One greenhouse, 150 ft. long, for \$4.00 per month; 25 miles from N. Y.; 15 minutes from station. Good for roses or any other flowers. One other greenhouse to rent in same neighborhood, 100 feet away. Richard Hornbach, Floral Hill, Chatham, N. J.

FOR SALE—Owing to failing health, I will sell my florist business, established 17 years, beautifully situated between Larchmont Manor and Mamaroneck, N. Y.; 20 miles from New York, near railroad station; trolley lines within one minute's walk. First-class opportunity for the right man. Plenty of landscape and jobbing work. The place contains four acres, 2 greenhouses, 104 feet long, and lots of sash; well stocked with trees and shrubs, etc.; horse, wagon and tools. This place must be seen to be appreciated. Address, Box 44, Larchmont, N. Y.

FOR SALE

FOR SALE—At bargain price, 1000 feet 3 in. pipe, guaranteed sound, at 6c. per foot. Complete with couplings, the lot for \$50.00. Engelman & Son, Pittsfield, Mass.

FOR SALE CHEAP

To be torn down, seven greenhouses containing 15,000 feet glass, with steam heating apparatus, piplog, etc. Address, M. S. M., care The Florists' Exchange.

FOR SALE—Four greenhouses, all stocked with carnations, chrysanthemums and smilax. Seven acres of land, seven-roomed cottage. Thirty miles from New York. Address, S. N., care The Florists' Exchange.

FOR SALE—Greenhouse material and hot bed sash, milled from Gulf Cypress, to any detail furnished. Oxford putty, specially made for greenhouse and hot bed sash. V. E. Releh, 1429 Metropolitan Avenue, Brooklyn, N. Y.

FOR SALE—Burnham Improved nine-section (2,400 ft. Radiation) hot water boiler; like new, used only last winter; will sell for \$100.00 less than net factory price for cash. Am changing my plant to steam heat, hence above sale. C. B. Shisler, Williamsville, N. Y.

SOUND, second-hand pipe with new threads and couplings. 2000 feet, 3 in., outside diameter pipe, 8c. per foot; 500 feet regular 4 in., 18c. per foot; 3½ in., 15c. per foot; 2½ in., 9c. per foot; 6000 feet, 2 in., extra heavy, not threaded, 8c. per foot; 10,000 feet, new, ½ in., not welded, for fences, supports, etc. We make concrete fire-proof columns. Prices mailed on application. Pfaff & Kendall, Foundry street, Newark, N. J.

FOR SALE—On account of my health, I am compelled to offer my greenhouse specialty business, which includes the Standard Duplex Gutter, which is fast coming into use by the growers. This season many thousand feet were erected, and at present am shipping a large range to California, also the Standard Steam Truss and the Ventilating Machine. My business is thoroughly established; none better; and is doing a large business all through the season. Address, E. Rippard, Youngstown, O.

FIRMS WHO ARE BUILDING.

PARIS, KY.—John Crisman will build a greenhouse, 73x300 feet, on Nineteenth street.

SHELDON, IA.—John Christiana is adding 2,000 feet of glass to his establishment.

FULTON, IA.—Hill Brothers will erect five more greenhouses, each 200 feet in length.

NORTH ABINGTON, MASS.—The Bay State Nursery Company is making extensive additions to its plant. The old office building is being doubled in size and capacity. A private office will be put in on the north side of the new building and the general offices will be on the south side. Improvements are also to be made upon the land recently purchased in that vicinity.

July 27, 1907

A Modern Don Quixote.

Editor Florists' Exchange:

It is certainly sad in his declining years to see the modern Don Quixote going to pieces. I refer to Job. He answers a letter, then after some time, forgetting I suppose that he had done so, he again sails in; but his style is labored and heavy—really out of his original class. Whether he had been imitating Rip Van Winkle and Jemima woke him up, or some of his favorite fleas bit him, history alone will tell us. Experts usually go that way. It is a penalty which they have to pay for their greatness or smallness, which depends on the color of the glass or glasses they are seen through. Or probably he may have been taking lessons from some fourth rate Bowery orator, which may account in a measure for the latest and some of his previous exertions. There is a story told of a girl who wept very easily. The reason given was that her grandmother had been a sensational actress and her mother had worked in an onion cannery; and by the same token Job's grandfather may have been a stone mason and his father a carpenter, which may account for his "knocking."

Referring to your Canadian contemporary of recent issue: we will be a long time dead and a little fun, even if it is in trade papers, does not, to my mind, interfere with any serious article printed in the same issue; and some of the articles written are so mighty serious that it is misery to wade through them. If your Canadian brother is going to feed his subscribers on serious topics there will be many solemn visages seen in Canada.

Natick, Mass.

R. T. McGORUM.

Stray Notes from Across the Atlantic.

One of our weather prophets is predicting a warm and normal Summer save for one or two cool periods in July and August. The first half of September is to be warm, and then back we go to Winter. Roll on, Winter! we know what to expect at that time. We are about four weeks behind the normal, while those living near the sea, where it is warmer and less exposed, are quite a fortnight behind time. Autumn sown sweet peas in the low lands have been in bloom for about a fortnight, but the greater part of the flowers have been bruised or wilted by the wind. Spring sown sweet peas are just commencing to flower and the blooms are of excellent quality. For myself I cannot record the cutting of a single flower save of Burpee's Earliest White.

The National Sweet Pea Society did well to fix its show date, eleven days later than last year, which was done to give poor beggars like myself a chance. But it is no go; for I want another eleven days besides, that is, provided the weather improves. If it keeps on as at present, and it is enough to compel one to do navy work in a jacket, I calculate my plants will be in their prime somewhere about the end of August. They are growing a little, and I've actually got a few 3 feet high, and strong enough to yield good flowers. Buds are showing, and I am pleased to be able to record that those two fine American sorts—Helen Pierce and Brilliant Blue—are showing haulm nearly one inch wide and foliage over 3 1-2 inches across.

I reckon on seeing hot stuff presently, for the above varieties together with such sorts as Helen Lewis, Albatross, Mrs. Chas. Mandle, Cecil Crier, Codsall Rose and a few other special seedlings, are carrying four huds on a stem, the later being 3-16 of an inch thick. Sweet peas are selling readily, but owing to the extraordinary wave of popularity that is sweeping around, everyone with a bit of garden is growing them, so that there will be no chance of high prices except for first class flowers.

It is, and always has been, amusing to me to observe people's astonishment when they first see well grown sweet pea flowers, and since I exhibited some top notch stock locally, there has been quite a revolution. Formerly, everyone about here, cottagers, gardeners and florists, were content to sow mixed seed thickly out of doors, and they thought their flowers really good if produced in threes on 8 or 9-inch stems. Now everyone sows in pots and sets out in April, giving the plants plenty of room, and having only the best varieties. They all seem to be bitten with an intense desire to surpass your humble servant at sweet pea growing, which is a source of great delight to me. Still, one has to experiment a little before he learns how to grow sweet peas 2 1/2 inches across, four and five on a stem, the latter running 20 inches or more in length. It is

quite possible to get the new wavy or orchid-flowered type in such form, and our worthy amateur champion, Thos. Jones, of Wales is not very much excited when Mrs. Hardcastle Sykes comes 5 on a stem 25 1/2 inches in length. I am really glad that I succeeded in worrying Mr. Burpee to come over again this season, and I anticipate seeing him gasp when he looks in at the big show. He had a great shock when he saw the Welshman's, America in 1905.

The ways of your gladioli men are charming. It looks as if you need a society to look after the gladioli's interest. Maybe then we should learn how such varieties as America did originate. Personally I cannot see why such a pother is made. No one seems to be able to quote its parentage; and unlike our sweet peas, such as Helen Lewis, it does not appear to have been a sport.

The note respecting slugs on page 744 reminds me that I am booked for a hunting expedition this evening. Personally, I find the "catch 'em and kill 'em," is the only remedy. Owing to the frequent showers, this season there are hordes of these pests about, and nothing in the way of powders acts as a check. Lime, soot, and other patent killers only serve to make the pests seek out a spot untreated. Slugs have first-rate powers for fasting, and they'll travel about until they find a spot where they can cross over and attack one's treasures. It is a giddy game running round the sweet pea plots with an acetylene lamp after 10 p. m. but it is the surest way of saving the loss of promising plants.

I was pleased to see the note on snapdragons by Mr. Timme, but I can't quite see eye to eye with him when he speaks of short stems the first season. It depends upon the strain. We have the Tom Thumb, dwarf and tall sort, and if sown under glass in early March and kept growing until planted in good soil, the latter will run up a yard high. It is very rare we can get them to stand over the Winter outdoors. For cut flower work I would certainly recommend growing named sorts, such as Cottage Maid, White Queen, Crimson King, and Yellow Queen. Seedlings are unreliable, for one generally gets a large percentage of dirty washed out pinks. There are a hundred or more named sorts in being, but the greater part of them are speckled or striped, which, to my mind, are not so fine as the self colors. Cottage Maid, by the way, is a bicolor, being pink and buff; truly a lovely thing.

I was extremely interested in George Hollis's letter regarding peony seed, for I have had similar points forced home to me with other crops. For many years past it has been recognized that potato seed, "really tubers" grown in Scotland are far superior to those grown in the South of England. I have dahbled just a bit in potato culture, and I note that all the best American seedsmen have their potato seed grown in the Northern States. Potatoes grown in the South especially on light soil are, unless very carefully selected, liable to curl disease, which almost or entirely prevents growth, with the result that no crop is obtainable. It was a puzzle to many as to why Northern seed should be superior, but it has been definitely proved that it is due entirely to the fact that the tubers never ripen as thoroughly as they do in the South. Moreover, it has been found that by lifting potato crops grown for seed before the haulm has died down much better seed is obtained. That is to say, tubers that are not fully ripe, give a better and much more reliable crop than those that are dead ripe. Of course, there is a certain stage of ripeness necessary in seed potatoes, for if lifted too soon, the tubers will go soft and be useless. I myself have for several years made a practice of carefully selecting seed potatoes, and in no case does curl disease follow. Others to whom I have given portions of my stocks, declare they never had better results.

Of course some will argue that a potato is quite a different thing from a peony seed. It is, yet it isn't. The potato is really a portion of stem with a varying number of buds. The peony seed like the potato is simply a mass of starch, with its accompanying bud.

In the same way I have found that my own late saved sweet pea seed gives better results as a rule than properly perfected seed.

Since I discovered the sportiveness of Countess Spencer I have saved my own seed, and last season my plants were absolutely free from variations, the plants being very strong. Thinking that it would be inadvisable to keep saving my own stock, and knowing that I would get reliable stock elsewhere, I gave away all my own saved seed this Spring, and got in fresh. My bought in seed has practically proved a failure, the plants being poor in the extreme. Those who are growing from my seed report extremely strong growth, yet my seed was rubbishy compared with the

seed bought in. It is in this way that I think the explanation respecting the peony seed's antics lies. Mr. Hollis presumably had to wait for the last lot of seed to reach maturity, which it probably did under cooler conditions than the first lot that doubtless were much harder than the second batch.

H. J. Corfield argues pretty well respecting "sports," still, I can't fall in with him on all points. A sport is not directly the result of cross-fertilization. It is an old saying that "like produces like," but such is not the case all the time. A flower that contains both stigma and stamens will, if not interfered with in any way, produce seed which will give plants producing flowers exactly like their parent. Sometimes this rule is upset; the variation is then a natural sport. A seed pod contains, say, a dozen seeds, which when sown produce plants, eleven of which are the same as the parent, the other differs. The latter is surely a natural sport, always supposing that no foreign pollen had been introduced into the one ovule. Taking animal life, who can possibly work things so that the offspring are identical with the parent? It cannot be, for while many, or the majority of flowers possess male and female organs, all animals are divided into two sexes, and there must be copulation before offspring is produced. Seeing that every animal, or human being for that matter, differs in some way or other, can it be expected that the offspring will be exactly like one or the other of its parents? Why, the same parents cannot produce a second identical to the first. There may be resemblances but no two are identical. This is entirely due to cross-fertilization, or blood mixture. If animals were built on the same lines as plants, the majority of which produce flowers possessing both male and female organs, then we might expect to see the offspring resembling its parent. Such, however, is not the case, consequently all animals are the product of cross-fertilization, not hybrids, mind, for the true hybrid is the product of two distinct species, as in the mule, which is the result of a cross between the horse and the ass. Hybrids in animals are mostly sterile, and plants not infrequently so.

Mr. Corfield refers to the rose Bridesmaid as a sport, it arose from a vegetative bud, and undoubtedly it came from a plant that was in itself a seedling from some cross. Bridesmaid, however, if it came from a vegetative bud, is not directly the result of cross-fertilization. It is a sport pure and simple. Everyone knows that Breeder tulips flowered from seed are self-colored; sooner or later they break into stripes or other markings. This breaking is expected, but no one knows when it will occur. The self-colored Breeder is the result of a cross; the breaking is due to the fact that the mixing of the pollen has disorganized the plant's system.

Personally, I think there is a great deal of difference between plants and animals, although all are the product of an ovule or seed. The higher up the scale one gets, the less tendency there is for two to come alike, until we reach the genus homo, which never produces two alike, therefore it has no need for sporting.

There is no mistake but that the American type of carnation has got a firm hold, but as stated on page 834, the fringe-edged flowers were dead set against for a long time. At the time that Mrs. Lawson was introduced there were many scoffers as to its value, and on more than one occasion my notes respecting the American type received but scant attention. I was growing Governor Roosevelt and several others some years before the fringe-edged sorts found favor as they have now.

I am pleased to note how popular the geranium and verbenas are in the United States. I have always been interested in these flowers, although I am not growing them now. I was very much surprised to receive the splendid little catalogue issued by R. Vincent, Jr., & Son. As a geranium list pure and simple, it is a long way ahead of any list issued here. In fact, I know of no firm, not even our big specialists like Cannell, H. C. Jones and Behers, issue such a beautiful little book dealing with geraniums or correctly zonal pelargoniums.

The same may be said in a smaller way of Dillon's of Bloomsburg, Pa. Verbenas about three decades ago were highly thought of in this country, the named florists' sorts being famous, especially those raised by the late Henry Eckford, of sweet pea fame. They went out of fashion, however, and save for the beautiful Miss Willmott, I hadn't seen a named verbenas until H. B. May put up a number of fine sorts at the recent Temple show. It's quite likely that verbenas will become popular again, especially if the American sorts are first class. The great bother with verbenas over here in Winter is mildew.

T. A. WESTON.

A RECORD BREAKER

GODFREY ASCHMANN of Philadelphia, the

Well-known Araucaria Specialist of America

Watch Us Grow

1907 is now the twelfth year of our anniversary in a successful career in the importation, growing and shipping of that well-known and much admired evergreen decorative plant, the Araucaria Excelsa, Compacta, Robusta and the Glauca. Beginning with the first year (1896) with an importation of 100, this year (Spring 1907) our importation has swollen up to the enormous quantity of 6,000 in the well-known, three best varieties, the Araucaria Excelsa, Compacta, Robusta and the Glauca. Our Araucarias are so well introduced that at the present time they represent every city, county and state of America, as far as Cuba and Mexico, and from the Atlantic to the Pacific Ocean. It is always my earnest desire to improve my system in buying, raising, selling and shipping our production to such an extent, that it not only benefits ourselves, but so that it will yield a fair profit into the pockets of our buyers. Now is your chance and the time to fill your empty houses and make money fast, as the plants will grow into money while you sleep.

ARAUCARIA Excelsa, 5 in. pots, 10-12 in. high, 3 tiers, 2 years old, 60c. each; larger sizes, 6-6½ and 6 in. pots, 2-3-4 years old, 60c.-75c.-\$1.00 to \$1.25 each.
ARAUCARIA Compacta Robusta, 6 in. pots, 2-3-4 years old, 10-12-16 to 18 inches high, 3 to 4 tiers, \$1.00-\$1.25-\$1.50-\$1.75 to \$2.00 each.
ARAUCARIA Glauca, 3-4-5 tiers, 2-3-4 years old, 10-12-16-18 to 20 in. high, 6.

Please state if plants are to be shipped with or without the pots.

Cash with order please.

THE FLORISTS' EXCHANGE.

(6) **Hardy Lilies for New York State.**—Do you regard either or both *Lilium auratum* and *Lilium candidum* as permanent and hardy for outdoor planting in this locality (New York State)? That is to say, will they continue vigorous and bloom freely for a number of years if undisturbed?

New York.

W. F. B.

—*Lilium auratum* and *Lilium candidum* are both hardy in this State, though it is always well to give them a mulch of litter for winter protection. If this is done they grow and flower profusely year after year, without being disturbed.

Chicago Florists' Club Outing.

The great anticipations which had been indulged in relative to the annual outing and picnic of the Chicago Florists' Club were fully realized at Morton Grove on Sunday last at the new picnic grounds, where upward of four hundred, including members, their families and friends, gathered to do full justice, either as spectators or participants, to the full line of events, to indulge in the several forms of amusement and pastime, to partake of the good things to eat and drink and generally to enjoy a pleasant day, in a pleasant place among pleasant associates.

The weather, though somewhat gloomy in the morning and threatening at times during the day, turned out to be ideal for a picnic, not a drop of rain interrupting the festivities, clouds tempering at times the fierce rays of the sun to the ball players and others who were exposed to them, and with humidity and heat sufficient to make the doffing of unnecessary garments and the seeking of the cooling shade of the trees desirable to nearly all.

About two hundred excursionists met at the Union Station and boarded the 9:30 train, while the later trains brought generous additions and many other parties arrived throughout the day in automobiles, carriages and other conveyances. At the grounds the picnicers divided up into families or parties who made headquarters for the day in sections of the grove where ample accommodations as to seats and tables had been provided.

The committee were unstinted in their activity and were to be seen in all directions, keeping the wheels moving, and it is to their untiring endeavors that much of the success of the whole affair is due. Ed. Enders, H. N. Bruns, Charles Balluff, August Poehlmann, T. E. Waters, George Asmus, Henry Klunder, John Zech, and John Degnan were the active members in this field after the start, each carrying out his allotted duties in exemplary form.

The day was a hot one, almost too hot for visiting greenhouses, yet the temptation was so strong, that all day long the Poehlmann Brothers' houses, especially plant B, a large part of which was erected last year, proved a strong attraction to many visitors.

President Bruns presided over a side show of throwing baseballs at the dolls which proved attractive and remunerative, while each ticket holder was privileged to guess the number of beans in a fruit-jar in charge of Mrs. Waters. Cliff Pruner won the ten dollar gold piece by guessing the exact number, 1133, while the five dollar gold piece was divided among four contestants who came within two of the correct number. Music was furnished throughout the day and various forms of amusement were indulged in as fancy dictated.

The baseball game attracted many to the outside field and though only six innings were played it was certainly, for scratch nines, a remarkably well played and interesting game, resulting in a victory for the wholesalers by a score of 5 to 2. Umpire, John Zech.

The tug of war was the most trying ordeal of the day, two of the contestants becoming exhausted at the end of the three minutes' severe strain. The result was very close, but was decided in favor of the retail crew.

Following is the list of events and the successful contestants:

Forty Yards, Girls 10 Years and Under.—Elsie Fifer, Madeline Bruns.
 Forty Yards, Boys 10 Years and Under.—Ed. Flabin, Geo. Loutsh.
 Forty Yards, Girls 16 Years and Under.—Alma Quiran, Marion Garland.
 Fifty Yards, Boys 16 Years and Under.—Fred Schnapp, Earl Poehlmann.
 Fifty Yards, Young Ladies.—Annette Dupree, Mary Dupree.
 Fifty Yards, Married Ladies.—Mrs. B. Belcher, Mrs. C. A. Klunder.

WILLIAM K. WOOD.

HAIL NEWS.

PRINCETON, ILL.—During a recent storm hail damaged glass in the Ericson greenhouses to the extent of about \$25. Yoder's vegetable houses sustained a loss of about 200 panes of glass. In money the loss is about \$40.

Florists' Hail Association.

The Florists' Hail Association is a New Jersey corporation worthy of favorable mention by us, says the Texas Stockman and Farmer. The most prominent florists in the United States are members of this Association, the object being "mutual protection against damage to glass by hail." More than \$105,000 in losses have been paid by this Association since its organization. All claims properly presented have been satisfactorily settled. John G. Esler, Saddle River, N. J., is the efficient and popular secretary.

DELAWARE, O.

CARNATIONS

Lifting and planting in the houses should be accomplished as early as possible. I have always planted in August, but would plant earlier if possible. By keeping the plants well cultivated they can be taken up at any time regardless of whether it is wet or dry. A dry time is best, because then the foliage is rather hard and not easily injured by wilting.

I like to leave on a ball of dirt about three inches in diameter which, when planted, helps to keep them erect, and also from wilting badly the first few days. Until the plants begin to send out little rootlets, they are sprayed once or twice a day according to the weather, also kept well watered. After the roots have taken a good hold, watering is only done when needed, and then thoroughly. At this time it is necessary to keep the soil wet enough and still not too wet, as the plants have not as yet taken a strong hold, and the soil not being full of roots, is easily and quickly soured. Thorough cultivation will help much to avoid this, and should be done often.

As soon as the growth commences, the shade on the houses should be removed plenty of ventilation should be given, and the plants never allowed to suffer for want of water. After the plants are larger and beginning to bloom, the soil, being full of roots, helps much to keep it sweet, so it is not necessary to cultivate so often.

Fumigating and syringing should be well taken care of regularly, and green fly and red spider kept out of sight. Nothing causes so much loss and annoyance as a crop of these pests—A. J. Stahelin, before Detroit Florists' Club.

New York.

News of the Week.

The approaching convention of the S. A. F. O. H. is beginning to interest the craft in this city, and present indications point to a good sized delegation from here. It is rumored that the first session of the convention will not be called until 2 p. m. on the opening day, Tuesday, August 20. If that change in the opening hour should be verified from headquarters, it would seem that the New York delegates can arrive in Philadelphia in plenty of time by starting on the same morning, as the run does not take much over two hours time. As soon as the hour of opening the convention is officially decided upon, however, the transportation committee of the Florists' Club will make the necessary arrangements, and each club member will be notified when the delegation will start for the convention city.

James McManus went with his lodge to the Elks convention, held in Philadelphia last week, and took part in the big parade—nine miles of a walk in the hot sun, and hundreds of people overcome with the heat and having to be picked up from the street and taken to hospitals. It was not the paraders, however, that suffered; it was the sightseers who were crowded on the sidewalks along the line of march, and who, in their endeavor to keep cool, were imbibing a deleterious lemonade offered for sale by itinerant peddlers.

Benjamin Hammond, the secretary of the American Rose Society, is president of the Board of Education of his home town—Fishkill Landing, N. Y. As such he has just issued his annual report; it is an interesting document.

A thorough investigation by the United States Department of Agriculture has revealed an alarming decrease in farm land valuation in New York State. It is found that 12,000 farms have been abandoned, and compared with the valuations made in the early eighties, there is a decrease in value of \$190,000,000; the population in remote towns in some instances has also decreased from 40 to 50 per cent. According to the reports, the country is being absorbed by the cities, and a state convention is to be called to plan a remedy.

Park Commissioner Herrman has removed Frank Joyce from the office of superintendent of parks in Manhattan "for the good of the service." Mr. Joyce got this position through political influence some time ago, the salary being \$3,000 per year. The park commissioner has received a communication from the City Club recommending that the services of a qualified landscape gardener be secured, and that the salary for the

office be increased to at least \$6,000 per year. This seems like a good suggestion from the City Club, as it is certainly no place for a politician who is entirely ignorant of any branch of horticulture to be superintendent of parks in a city such as New York is.

Word comes from Trenton, N. J., that the epidemic of typhoid fever which is prevalent at the State Hospital for the Insane has been caused by the patients picking pond lilies that are growing in the pond adjoining the institution and amusing themselves by sucking the stems. The water of the pond has been analyzed and found to be infected with colon bacilli.

John Scott, the Flatbush florist, sailed on Saturday, July 20, for Europe, on board the steamship Leeland, where he will visit his old home in Scotland and many of the prominent growers of both England, Ireland and Scotland. He will also make a tour among the growers of Holland and Belgium. Mr. Scott expects to be back in time to attend the convention of the S. A. F.

M. A. Bowe, the retail florist at Thirty-fourth street and Broadway, has just been granted a decree of divorce from his wife on statutory grounds. The case was tried before Edmund J. Tinsdale as referee, who recommended that the complaint be dismissed, but Judge Bischoff of the Supreme Court ordered that Mr. Bowe be granted an interlocutory decree.

President of the American Rose Society, Robert Simpson, together with Mrs. Simpson and two of their children, will sail for England on board the Caronia on Tuesday next, July 30, expecting to return home on September 7 on the steamer Lucania. While abroad Mr. Simpson will travel through England and Scotland.

Julius Roehrs of the Julius Roehrs Company, Rutherford, N. J., and Adolph Sachse, orchid collector, who recently arrived home from Pernambuco, sailed for Europe, July 23, on board the steamer Friedrich der Grosse. On his return to the United States Mr. Sachse will proceed to South America on another orchid collecting tour.

J. K. Allen, the wholesale florist at 106 West Twenty-eighth street, together with Mrs. Allen, will leave on August 3 for Atlantic City, where they will stay until the convention of the S. A. F. O. H. to be held in Philadelphia, which they will attend on their way home. Miss Smedley, Mr. Allen's bookkeeper, is back from her vacation spent in the mountains.

The Department of Parks is advertising for sealed bids or estimates, which must be submitted at the office of the department, Arsenal Building, Fifth avenue and Sixty-fourth street, by 3 o'clock p. m. on Thursday, August 1, 1907, for furnishing all the labor and materials for completely erecting and constructing a greenhouse in the Botanical Garden in Bronx Park, in the City of New York.

C. W. Ward of the Cottage Gardens Company, Queen, N. Y., is on a visit in Detroit, Mich.

Buffalo, N. Y.

News Notes.

S. A. Anderson has built a new house, 18x100 feet, to take the place of one recently torn down at his Elmwood avenue range.

Walter Stroh of Palmer's is spending his vacation at the home of his parents in Batavia, N. Y.

Charles Sandiford at Albright's place has recently erected houses which are devoted to growing fruits of various kinds.

DAYTON, O.—Officers were elected, the report of the secretary read and a dividend of 10 per cent. declared at the annual meeting of stockholders of the Miami Floral Company. The officers elected are: President, Charles E. Pease; vice-president, William Kiefaber, Sr.; secretary, Edward A. Deem; treasurer, William Kiefaber, Jr.

BUSINESS DIFFICULTIES.

DAYTON, OHIO.—Judge Brown, of the Common Pleas Court, has appointed Ralph H. Gibson, Sheriff of Miami County, as receiver of the Albangh Nursery and Orchard Company, and his bond was fixed at \$10,000. The appointment was made on application of the Fourth National Bank of this city, which represented in its petition that the defendant company had liabilities of \$40,000. Noah H. Albaugh alone is surety on \$37,000 of the amount. In compliance with a decree of the Court the assets will be appraised and sold, the proceeds being applied to the liabilities. The balance remaining unpaid will be liquidated by the sale of Albangh's personal interests.

REVIEW OF THE MARKET

NEW YORK.—The cut flower business seems a little more settled than it did one week ago. Some lines of stock are shortening up considerably, and that leaves the market without such a heavy surplus of flowers. Still, of such things as sweet peas, feverfew and iris there are more than enough to supply the demand and prices are anything but firm. There is a fairly good supply of American Beauty, chiefly from outside sources, and it is a noticeable fact that only the short-stemmed ones are meeting with any call just now. There is practically no change in the condition of Bride and Bridesmaid roses; the supply while low, seems to be sufficient, and prices are unchanged.

Carnations are much scarcer than they were, and prices are somewhat better than those obtained a week ago. During the earlier part of the week the call for lilies became exceptionally good through some cause or other, and prices jumped accordingly. It is to be hoped that they will remain at the advanced figure right along, as there is certainly not much profit in growing lilies and selling them at \$2 and \$3 per 100. Gladioli are becoming more plentiful, and there are some high grade blooms coming in that bring \$1 per dozen. There are, of course, many others that realize about that price per 100. Lily of the valley is plentiful and while at times it sells at fairly good figures, there are occasions when it seems impossible to move it at any price. Asters are in the market—chiefly of the darker colors as yet—the asking price of which is five bunches for \$1, twelve flowers to the bunch. Green material of all descriptions is cheaper; even Adiantum Croweum had to be reduced in price.

CHICAGO.—Trade remains in the same dormant condition which has characterized it for several weeks past, the only items of general interest being the very evident shortening of the supply of carnations and a slowly increasing supply of asters. Everything else remains at the Summer level, so frequently reported of late—a condition very probable to obtain for some weeks to come with slight variation. The small supply of really good stock is readily disposed of, while the larger part received finds but a poor welcome.

W. K. W.

BOSTON.—Extremely warm weather the past week has shortened up the supply of flowers considerably and prices are a little more firm than they have been. Carnations a week ago were overloading the market with a raft of inferior blooms; now, however, they are not so plentiful and the quality is better.

Roses have been poor lately, and are not likely to improve for some time yet. Of course, there are some good varieties for this season, like Souvenir du President Carnot and Kaiserin Augusta Victoria.

Asters have made their appearance but only in small lots so far. Gladioli are good; and sweet peas are very good and plentiful. There are few lilies, but an ample supply of many other flowers which are called for only for special occasions or in small lots.

T. W. D.

ST. LOUIS.—Everything in our line remains quiet. The hot weather of the past week has broken up what little trade remained, and nearly everybody who can get away has left the city for the Summer. Funeral work is all that is doing, and that has been scarce the past week. The wholesale houses are having their troubles now in supplying first-class stock in roses and carnations. The roses that come in are of very little use to anyone, and the same may be said of carnations; \$3 to \$4 per 100 is about all the best roses bring, and 75c. to \$1 is the price on carnations. These will be scarce after this week as the growers are pulling out the old plants.

Asters are coming in good now, but are none too plentiful, so they sell out pretty clean at from 50c. to \$3 per 100; white and purple go best. Gladioli are coming in very freely, and the price is down to \$2 in 100 lots and 3c. in dozen lots. All the light shades have the call, the dark colors going begging after the morning sales are over. Sweet peas are almost over for the season; only very few are coming in, but are too short in stem to bring much.

The green market is in good condition, as everything one wants can be had in any quantity.

ST. PATRICK.

BUFFALO, N. Y.—Sweet peas are coming in an abundance; in fact, they are a glut on the market. At present good ones are not bringing more than 30c. to 35c. a dozen bunches, and are advertised by some of the retailers at 10c. per bunch, and then they are hard to move. Carnations are getting smaller every day, and asters will find a welcome awaiting them. Roses are small, excepting a few Kaiserin Augusta Victoria, which when they do arrive open so quickly that they do not amount to much.

W. H. G.

INDIANAPOLIS.—Masses of sweltering humanity seem contented with striving after the comforts of life and only resort to flowers when there are unusual occasions. Many deaths, customary in extreme weather, have caused funeral work to be ordered in amazing quantities. This work has been evenly distributed, as all the store men report a heavy call in this line.

Flowers are not so plentiful; high-grade stock is readily taken, and followed by advance orders for any additional which may be obtained during the week. The various kinds of lilies maintain a high standard and are always acceptable flowers at firm prices, i. e., Harrisii and auratum, \$15 per 100 rubrum and album Japan lilies, \$6 to \$8 per 100.

The local rose supply is small and unsatisfactory; those received from the lake regions are of much better quality. Good Kaiserin Augusta Victoria bring \$6 to \$8 per 100; small Bride and Bridesmaid sell on sight at \$2 to \$4 per 100. Killarney, despite reports to the contrary, does not keep long enough to prevent complaints from purchasers; ten hours in the refrigerators generally find it with the center showing.

Asters arrive in larger numbers each day, but a sharp lookout is kept for the select ones; \$1 to \$1.50 per 100 is obtained for them. Gladioli, field-grown, are shipped at \$2 per 100. A few tuberose are offered at 75c. per dozen stalks. The many varieties of garden flowers serve the window trimmer well in his display, for it is often a different problem to arrange the windows with a semblance of their grand Winter selves.

I. B.

CHANGES IN BUSINESS.

STROUDSBURG, PA.—J. Howard Stone has recently started in business here.

NORTH YAKIMA, WASH.—The Yakima Valley Nursery has been incorporated with a capital of \$60,000, by William D. Ingalls and Inga J. Ingalls.

BLOOMFIELD, MICH.—C. H. Crawford is moving his greenhouse plant to Excelsior, Minn., a suburb of Minneapolis, where he will continue his florist business.

FORT WORTH, TEX.—The firm of Baker Brothers Company has incorporated with \$40,000 capital, fully paid. J. B. Baker is president and general manager, and W. J. Baker secretary and treasurer.

JACKSON, MISS.—Professor A. E. McKay, for the past twenty years professor of horticulture at the Mississippi A. & M. College, has tendered his resignation to the board of trustees and will engage in the nursery, seed supply and floral business in partnership with his brother, J. F. McKay, and R. L. Addikson, of Madison Station. The McKay plantation at Madison Station, one of the finest in the State, will be utilized for the nursery and seed supply business, and a fine tract of land near Millsay's College has been secured for the floral industry. Construction work will be commenced within a few days on three large greenhouses, and the firm has secured the services of a professional florist and designer formerly connected with the A. & M. College. The industry will be incorporated under the laws of the State and the business represents an investment of about \$25,000.

Carnation growers who have a surplus of young plants should advertise them in THE FLORISTS' EXCHANGE.

THE STANDARD TREATISE ON GARDENING.

THE GARDENER'S ASSISTANT

New Edition.

UNDER THE DIRECTION AND GENERAL EDITORSHIP OF

WILLIAM WATSON

Curator, Royal Gardens, Kew.

Thoroughly Up-to-Date; The Recognized Authority on Gardening; Most Distinguished Contributors; Lavish in Illustration; Indispensable to Practical Florists and Gardeners, to Country Gentlemen and the Amateur. A Complete Encyclopedia of Gardening. The Leader Among Gardening Books.

For the past half-century THE GARDENER'S ASSISTANT has maintained its unique position as the **standard treatise** on practical and scientific horticulture.

The publishers in this new edition have given this monumental work such a **complete remodeling, revision and extension** as will enable it to hold in the twentieth century the place which it worthily filled throughout the latter half of the nineteenth. It is so thoroughly up-to-date, and is so comprehensive in scope, as to constitute a **complete encyclopedia** of all that is known about the science and art of gardening. No one who wishes to excel in gardening, either as a business, or a hobby, can afford to be without it.

THE GARDENER'S ASSISTANT is a compendium of all operations of the garden and arboretum; from the formation of the garden and plant-houses to the cultivation of all kinds of plants, whether for use or ornament: trees, shrubs, herbaceous and alpine plants, stove and greenhouse plants, orchids, ferns, succulents; fruit, both under glass and in the orchard or kitchen-garden, and vegetables of all kinds.

Everything has been done that could be done to elucidate the text by the free use of **illustrations**. These represent recent gardening appliances, houses, heating apparatus, flowers, trees, diagrams, schemes for laying out the garden, methods of pruning, etc. In fact, wherever a picture would be useful a picture is given. Moreover, in addition to the black-and-white text illustrations, there are twenty-five full-page black-and-white plates, and eighteen colored plates of flowers and fruits, specially prepared for the work by eminent artists.

THE FIRST PORTION of the work deals with **GENERAL PRINCIPLES**; THE SECOND PORTION is devoted to directions for the **CULTIVATION OF DECORATIVE PLANTS OF ALL KINDS**—stove, greenhouse and hardy trees, shrubs and herbaceous plants; THE THIRD PORTION treats upon **FRUIT CULTIVATION** in all its branches, both under glass and outside; and THE FOURTH PORTION upon the **GROWTH AND MANAGEMENT OF VEGETABLES AND HERBS**.

THE GARDENER'S ASSISTANT has been made the **SOUNDTEST and MOST PRACTICAL**, as it is unquestionably the **NEWEST and MOST UP-TO-DATE**, Book on Horticulture.

SEND FOR PROSPECTUS.

We have obtained the exclusive right to the sale of this invaluable work in the United States. It is elegantly printed, on thick, durable paper, in two handsome imperial 8vo. volumes, substantially bound in Roxburgh, half leather, cloth sides, marbled edges, about 1300 pages.

PRICE, delivered free, by express, to any part of the country, cash with order, \$15.00. Money refunded if not satisfactory. Or, we will send purchaser the two volumes on receipt of a first payment of \$4.00 and six monthly payments thereafter of \$2.00 each.

Cincinnati.
News Notes.
E. W. Guy, florist, Belleville, Ill., was a caller on Thursday.
D. Rusconi, who is head and front of the Florists' Club outing, has decided to go to a place on the C. L. & N. R. R., called Highland Park, about one half hour's ride from the city. August 1 is the date. All make up your mind to go; it will be a good old-fashioned basket picnic, and be sure and see that the basket is well filled. There will be all kinds of sports at this outing.
So far I have not heard much S. A. F. O. H. talk, and I doubt very much if Cincinnati will have even a semblance of a delegation.
I expect to take my wife and daughter to Manistee, Mich., about August 9, returning about September 1.
Mrs. Glines, mother of Henry, Ben and Joe, died on the 14th of this month of old age. She had been failing for several months.
Housecleaning with the wholesalers is now the order of business. L. H. Kyrk's place is as clean as a new whistle. Wm. Murphy has moved to Main street and has a ground floor. Critchell has just finished remodeling. All are getting ready for the vast amount of business we do not have during the Summer.
E. G. GILLET.

KANKAKEE, ILL.—The marriage of George Faber, florist to Miss Apollonia Wink of Milwaukee, Wis., was celebrated on July 17 at St. Mary's church.

Trade News.

Among the retail trade a general scarcity of business has prevailed the past week notwithstanding a rather unusual demand for funeral work. Sweet peas are about gone, owing to the torrid wave which swept over the district last week, and asters have not yet made their appearance except in very limited quantities by no means supplying demands. Astors at this season usually constitute one of the principal supplies. The shortage has increased sales of pond lilies which are good and in sufficient numbers to meet the call.

One of the most notable funerals of the past week was that of "Honest John," an Indian chieftain who had won for himself the highest esteem of not only his own tribes but of our greatest statesmen, by his high principles and executive ability in securing from Congress appropriations with which to reimburse the various tribes he represented for the lands of which they had been deprived. Just a week prior to his death, a claim for nearly a million dollars was adjusted satisfactorily. The casket containing the remains was shipped to New York, and was covered with flowers. Most noticeable among the floral tributes were bows and arrows constructed of immortelles.

While the thermometer scarcely reached the nineties, last Friday was the most oppressive day of the season; the humidity was intense, and much suffering resulted. Rains of a destructive character to vegetation have visited nearly all sections of the country around Washington, but that section lying directly northwest is suffering, and crops are beginning to burn. The torrid wave greatly assisted field crops, but nothing has recovered entirely from the effects of the late Spring. Vegetables are both scarce and high in price.

JAS. L. CARRERY.

DAVENPORT, IA.—The members of the Tri-City Florists' Club and their families held an annual outing Thursday of last week near the Black Hawk Watch Tower. There was a large attendance of picnickers and a very pleasant day was spent. Various games were indulged in and a social game of baseball played. There was a short business session before the pleasure began and one new member was proposed.

The next regular meeting of the association will be held with John Staack of Moline on the second Thursday in August.

MILLBROOK, N. Y.—W. C. Russell, who for many years was superintendent at Ithaca, is now operating the business of florist and landscape gardener, which was formerly carried on by H. J. Smith. Chas. Mitchell, greenhouse builder, Poughkeepsie, N. Y., will build for Mr. Russell a greenhouse 70x20 feet.

Two new greenhouses are being built on the estate of John D. Wing, one 120 x25 feet and the 50x25 feet. Vincent Brothers, Millbrook, are the builders.

Summer trip to points of horticultural interest including the Philadelphia convention.

Charles Balluff and Mrs. Balluff left the first of the week for a three weeks' vacation tour in the neighborhood of his birthplace and former home in the lake section of Northern Wisconsin, where he expects to enjoy some fine fishing. His vacation will wind up with the excursion to the S. A. F. O. H. convention.

The house of Wieter Brothers can again score one on the slate of good fortune; having planted their field carnations on light soil this year the plants have found the conditions congenial and have made an excellent growth, the continual rains having been just to their liking.

Charles Schneider of the Central Floral Company notes the remarkably increased demand for and interest in our native flowers more or less of an assortment of which, correctly named, he continually displays in his State street window. Lady's slippers, daisies, and many others have been handled in large quantities, and though the sales are small the percentage of profit is reasonably large.

It is now eighteen years since W. L. Palinsky purchased the location of his greenhouse establishment on Palmer avenue, then a comparatively remote farming district, and he has witnessed a wonderful transformation in the vicinity which is now thickly settled with stores and residences reached by both surface and elevated electric transportation and equipped with all modern utility improvements. His location is favorable to the general retail line which he pursues and not so far out but it is convenient for him to reach the market with the generous line of bedding and other plants which he wholesales. Two houses are planted to chrysanthemums; one or two are still partly filled with geraniums, fuchsias etc., to accommodate the late customers, while palms, ferns and the extensive assortment necessary to supply the wants of the local trade make up the remainder of his stock.

Victor Bergmann of the Ernst Wienhoeber Floral Company's staff has planned for a pleasant, eastern tour including a week in Pittsburg before the convention and after the week in Philadelphia a few days each in New York, Western Massachusetts and Boston.

Mr. Bobbink of Bobbink & Atkins, Rutherford, New Jersey, was in the city a few days last week.

At Jensen & Dekema's Foster avenue range the Summer work is well in hand, the houses, with the exception of some which were early planted now being all cleaned out and ready for planting from the field, which branch of the work will soon commence. The plants outside, though not as large as they have been in some years, are larger than they were last year and on the whole are in good shape. Planted early inside are a good experimental showing each of Beacon, White Enchantress, Winsor, Aristocrat and two novelties for next Spring—Scarlet (168) and Salmon Pink (46)—to be disseminated jointly by this concern and the originator, W. N. Rudd. All the inside stock is in good condition.

William Kroeschell of the Kroeschell Brothers Company is rusticiating and amusing himself with his camera for a couple of weeks in Wisconsin.

C. A. Alles, bookkeeper for Wieter Brothers, is taking his annual rest from roses and accounts.

Frank Williams is spending two weeks at West Baden Springs after which he will visit friends in East and the Jamestown Exposition.

Peter Blamenser, who died last week at Niles Center, was formerly a florist and was a member of the well known family of florists of that town. Of late years the deceased had devoted himself to a number of other commercial pursuits.

Among the limited quantity of high grade flowers coming into the market may be mentioned some consignments of Kaiserin Augusta Victoria roses handled by Percy Jones in the Flower Market.

Superintendent R. H. Warder of Lincoln Park has gone abroad.

Fred. W. Timme, our much esteemed contributor, accompanied by his wife and daughter, will leave shortly on a visit to England and Scotland; they will be gone for seven or eight weeks.

THE BOOK OF Water Gardening

This book supersedes all other books that have
 previously been written on the subject of aqua-
 tics and their surroundings, and gives in full
 detail all the practical information necessary
 to the selection, grouping and successful cultiva-
 tion of aquatic and other plants required in the
 making of a Water Garden and its environments,
 and covering all conditions from that of the Amateur
 with a few plants in tubs to the large estate or park

Duncan Robertson of the Wienhoeber
 staff, accompanied by Mrs. Robertson,
 left this week for the East, where at their
 former home in Boston and vicinity
 they will spend several weeks with re-
 latives and friends.

John Brod, Jr., manager for H. R.
 Hughes, has returned from a trip to
 Jamestown, Washington, Philadelphia
 and other points.

P. J. Foley has just completed an in-
 spection of property owned by a sy-
 ndicate, of which he is a member, located
 in Montana and embracing timber and
 mining lands and water rights.

It is not generally known that Charles
 Klunder enters the picnic races with a
 good deal of confidence, as he holds the
 world's record for 50 yards made in
 New York five years ago in five and two-
 fifths seconds.

The picnic is over and the committee
 is to be congratulated on the successful
 carrying out of all the details of the
 affair.

Fischer Brothers, Evanston, are quite
 expert amateur photographers and find
 that reproductions of their own designs
 and decorations prove a great aid to
 customers in making selections for retail
 work.

Robert C. Whitehill, representing
 Benj. Hammond, is on a Western trip
 and took a run over from a neighboring
 State to join in the pleasures of the club
 picnic last Sunday.

B. Eschner of M. Rice & Company,
 Philadelphia, arrived in the city Sunday.

One of our friends from Joliet was
 relieved of \$140, which was surrepti-
 tiously removed from his pocket while
 taking a trip across the Lake last Sat-
 urday.

Frank Oechlin, the Garfield Park
 Flower Company, has closed his store
 at 1688 West Madison street and is now
 devoting all his energy to the Adams
 street store. **WILLIAM K. WOOD.**

THE FLORISTS' EXCHANGE

Boston.

Sweet Pea Show.

The sweet pea exhibition of the
 Massachusetts Horticultural Society,
 which was held last Saturday, was very
 fine indeed and the immense quantities of
 these favorite flowers shown, gave the
 judges plenty to do to make fair awards,
 for there were in almost every class ten
 or a dozen competitors. Norris F. Com-
 ley of Lexington was one of the most
 extensive exhibitors and he captured
 three first and two second prizes. Other
 exhibitors of sweet peas who carried off
 prizes were Edwin L. Lewis, Wm. Read,
 Wilfred Wheeler, A. E. Hartsborn;
 Thos. Howden; O. B. Kendrick, and
 Mrs. F. S. DeLue. The Blue Hills Nur-
 series won the prizes for herbaceous
 plants, and T. C. Thurlow & Company
 had a collection of Iris Kämpferi. The
 Bay State Nurseries made an exhibit of
 herbaceous flowers which was very fine
 indeed, and the Harvard Botanical Gar-
 dens (Robert Cameron, gardener) made
 an attractive exhibit of aquatic plants.
 R. & J. Farquhar & Company had an
 extensive display of miscellaneous flow-
 ers.

First class certificates were awarded to
 Mr. H. H. Rogers (James Garthley,
 gardener) for display of stocks and to
 James McKissock for new delphiniums.
 A cultural certificate was awarded to
 W. W. Rawson for Delphinium Zalil,
 and George E. Davenport received honor-
 able mention for variegated nasturtium.

News Jottings.

The Crimson Rambler roses have
 been very fine in this locality this sea-
 son. There has been an extensive show
 of them on the estate of Thomas W.
 Lawson, where over six thousand plants
 have been used.

Dr. G. L. Goodale of the Harvard Bo-
 tanical Gardens left on Monday for a few
 weeks' sojourn in Europe.

Many horticulturists have recently
 visited the gardens of M. H. Walsh at
 Woods Hole, where the different Rambler
 roses have been exceedingly fine this year.

J. W. DUNCAN.

NEW BEDFORD, MASS.—The usual
 Summer dullness prevails, there being
 not much call for cut flowers just now;
 there is a great profusion of blooms out
 of doors. Sweet peas are now in full
 flower; these are of very good quality,
 but a little rain would help them. They
 are selling at from 10c. to 20c. per hun-
 dred, retail. Funeral work is quite
 plentiful here.

Davenport & Son is the firm title
 now on the windows of what was for-
 merly H. A. Jahn's store. Mr. Jahn
 will operate the greenhouses as usual,
 selling his cut direct from these. Carna-
 tions are about played out, and a
 week or so more will see their finish
 for the season; they are still being sold
 on Saturdays at 20c. per dozen, retail.
 The lawns and gardens in this section
 are much in need of water; all lawns
 are burning up, and vegetation is look-
 ing limpy. We need rain badly.

At a special meeting of the Horticul-
 tural Society held Tuesday evening,
 July 16, it was decided to accept the
 proposition of the Old Home Week com-
 mittee to hold a free horticultural ex-
 hibition in Odd Fellows Hall on August
 27, 28 and 29. Valuable prizes will be
 offered for the various exhibits. It was
 also voted to present to the Old Home
 Week committee at its general meeting
 silver and bronze medals to be offered
 for the best floral displays in the parade.

J. Garthley, gardener to Mr. H. H.
 Rogers, Fairhaven, exhibited some su-
 perb specimens of stocks—Beauty of
 Nice and Farquhar's Giant White. Mr.
 Chase had two vases of dahlias one of
 which, Roosevelt, would have done credit
 to an exhibit at a more favorable season.
 Messrs. Fish, Peters and Shaw were
 appointed judges for the occasion.
 James Garthley and William Keith were
 added to the executive committee.

Old Home Week is to be held in this
 city the last week in August; all the
 mills and factories are to shut down
 for the week. **HORTICO.**

Heating.
Growers' Problems Solved by U. G. Scollay.

I have just commenced building a greenhouse, 24x100 feet, and would like to inquire how to pipe same for hot water to a temperature of 60 in zero weather, and how much and what size pipe to use. The front walls will be 3½ feet high, 3 feet of which will be glass; the back walls, 4½ feet high; ridge, 11 feet high, the ends both of glass. The flows will enter the house from the back and 30 feet from the west end. I wish to partition off the house with a glass partition into a 30 foot length and a 70 foot length, and would like the house piped so that I can heat either division, separate or together if I desire. How many valves should be used and where should they be placed? I have another house, 16x60 feet, that will be heated by the same boiler. The ridge of this house is 9 feet, front walls, 3½ feet; back walls, 4½ feet. How large an expansion tank would it be necessary to use on the whole system?
A. D. E.
New Hampshire.

—As you will enter the greenhouse with the main flow and return about 30 feet from the west end, I would advise that you partition somewhere near this point and allow the 30 feet toward the west to be the small section. On this understanding, I would suggest the following: In the 70 foot section, 18 lines of 2-inch pipe arranged as follows: Five under each side bench, four under each center bench. You do not give the number of benches, so I must assume a great deal. In the 30 foot section I would advise six under each side bench and two under each of the two middle benches, making 16 pipes in the 30 foot section. On the far ends of each coil be sure and turn with elbows and run the same number of pipes to the doorways. You will have in all eight coils of pipe to take care of, and I would suggest that you put a full opening gate valve on each one. The valves should be placed with the flow line at a point near to connections from the large main. I would suggest that you enter the house with not less than 4-inch main and run it straight across next to the partition, and take connections for each section of the house from it. The expansion tank should have a capacity of about 60 gallons. Of course, you do not state the depth of your boiler pit, I assume that you can run this main from the boiler below grade, so that all coils can be connected from it without interfering with doorways. Of course, you will understand that this layout is calculated for 2-inch wrought iron pipe.

U. G. SCOLLAY.

I am building a greenhouse, 93 feet long by 20 feet wide, and would like to know how many runs of 2-inch pipe it will take, how many flows and how many returns? There will be two middle benches, 4 feet 8 inches wide; the side benches will be 2 feet 3 inches wide, the temperature of the water in boiler to be 160 at zero. I would like to know how many lineal feet of pipe can be safely used in a 2-inch flow, that is, 2-inch pipe? What arrangement of pipes would be the best? There will be glass in one end and 2 feet of glass under each gutter, or about 2,600 feet of glass to heat.
E. L.
New York.

—While you give me the temperature of the water at the boiler (160°), you do not mention the temperature you will require in the greenhouse. This is very essential to arrive at the amount of heating surface required, but I give you a layout suitable for 60 degrees in zero weather. You will require 14-inch runs of 2-inch pipe in this house. You can arrange the pipe four under each side bench, and three under each middle bench; those under the side bench will consist of two flows and two returns, and under the middle bench one flow and two returns. As you ask how many lineal feet of pipe can be used on a 2-inch flow, meaning 2-inch pipe, I assume that you would like to run from the boiler separate 2-inch flow and return mains for each coil. This will simplify your work, for you will only need to use the one size of pipe including boiler connections. I would therefore suggest that you arrange the boiler openings so that you will have four 2-inch flows and four 2-inch returns; you can then run direct from each coil to the boiler. About 400 feet of 2-inch pipe is my limit for one 2-inch flow and return. Place a full opening gate valve on each flow connection. This layout assumes that you can place the boiler below the grade of your greenhouse, so that all connections from the boiler to coils will not interfere with doorways.
U. G. SCOLLAY.

The Whilldin Pottery Co.
STANDARD FLOWER POTS

Our output of Flower Pots is larger than any concern in the World
Our Stock is always Large and Complete

Main Office and Factory,
713 WHARTON STREET, PHILADELPHIA
WAREHOUSES: JERSEY CITY, N. J. LONG ISLAND CITY, N. Y.

Having added two houses, each 10 by 120 feet, I intend to instal a new boiler. I would like to ask which would be the best way to pipe the four houses which are to be heated by steam; also, could I use hot water by putting in an expansion tank if at any time I desire to change to hot water? Would it work as well, provided I had enough pipe? Will pipe hung on the side posts work as well as they would laid side by side under the benches?
W. T. H.
New York.

—The 50-degree 10-foot house should have three rows of 1½-inch pipe—two under the outer bench and one under the inner one. The middle house should have six rows of 1½-inch pipe—three under each side bench. The 52-degree 10-foot house should have four rows of 1½-inch pipe—two under each side bench. The short 60-degree house should have equal to eight rows of 1½-inch pipe, the length of the house. Some of this should be placed across the exposed west end, but be sure you use a total of the above amount. Where possible to place pipes "on the flat," do it in preference to attaching them to side walls. A 2-inch overhead steam main for each house will answer. I would advise starting from the boiler with ¾-inch steam and return with 2½-inch. If you have any idea that you may ultimately turn the job into a hot water heating system, you should run all your returns, now, the same size as your steam, or what would in that case be your flow mains and connections. You should also, now, run the overhead main in the large house not less than 2½-inch, as the 2-inch would be scant for hot water. You should also, at all necessary points, make provision with tees for the attachment of such extra lines of pipe as you would require for hot water surface. You should also have room above highest point of steam main, in case you use hot water later on, so that your expansion tank can be properly placed and connected.

In steam heating, place a valve on each end of each line you wish to control.

U. G. SCOLLAY.

Utica, N. Y.

News Items.

The Utica Florists' Club members think they can give an answer to the Rochester florists conveying a little more encouragement than the Buffalo club did in the last issue of a contemporary. They can also give them a good constitution and by-laws, one under which we have been very successful the past eight years. We can do a little better with our meetings than twice a year, as we always have a good one every month, a large banquet and show in the Winter and a very successful clambake in the Summer, extra. We hope that Rochester will take Albany as an example and form a good club. Rochester, do not be discouraged; make a trial at least; our secretary will be pleased to give you any information desired.

The outlook for our clambake on August 14, 1907, looks very encouraging. The committee is working hard and should have a big crowd. We want to see every member and a friend or two present. Tickets can be procured of any of the committee, which includes W. A. Rowlands, C. G. French, Seward Hakes, Theodore Schesch and Secretary J. C. Spencer.

Robert Boyce is about ready to plant in carnations; he says he has about as good plants as he ever had. He has a good grower in Joe. Soder.

E. J. Byam, Rome, N. Y., is installing another very large tubular boiler. He has a fine lot of carnation plants in the field and a large house already planted.

C. F. Seitzer has a very nice house of young roses—the best to be seen around here, and has planted one house

A most uncommon thing is common sense. If you don't believe it, take a trip among your florist friends and you'll find about a third of them experimenting and testing some new fangle idea in boilers. A smooth talking chap has convinced them that any boiler that is economical for other heating, is economical for greenhouses. Let them try it out; it's costly but convincing. In the meantime, you had better be on the safe side and buy an H. & Co. Greenhouse Boiler made to heat greenhouses. Send 5c. in stamps for boiler catalog.

Convention Notes.

Convention matters are now up-
permost with all. On Friday and Satur-
day of last week, President Stewart was
here and Secretary Hanswirth was with
us all week. Meetings were held with local
members and the official program mapped
out.

The convention will open on Tuesday,
August 20 at 2 p. m. William Graham, A. B. Cartledge, and
J. J. Beneke, will be the S. A. F. com-
mittee on sports.

The local program will be: Tuesday
8 p. m., President's Reception; Wednes-
day, 1 p. m., Trip to Henry A. Dreer
(Inc), Nurseries at Riverton, N. J., by
steamer, and shooting contest at Wissi-
noming. After the shoot the contestants
will be taken across the Delaware River to
join the main party.

Thursday afternoon, bowling; ladies'
trip to Willow Grove, and luncheon at
the roof garden of H. Bayersdorfer &
Company. This latter will be from ad-
journment of morning session until 4
p. m.

As regards the bowling the Philadel-
phia Florists' Club is making great pre-
parations for this event. There will be
team bowling for the Whilldin Pottery
Company trophy, the Henry F. Michell
Company trophy and the Kasting cup,
besides other valuable prizes, there will
also be individual contests for men for
special prizes. The ladies will be well
taken care of; there will be prizes for
teams of five ladies and an individual
contest. It is hoped that all cities will
provide teams of both men and ladies.
Wm. Graham, 104 South Thirteenth
street, this city, is the chairman on
bowling; he would greatly appreciate
communications from all cities expecting
to send teams of men or ladies in order
to give an idea in the selection of suit-
able bowling alleys. Our committee
states that it is to give the bowlers the
greatest time they ever had.

On Friday the S. A. F. members will
be taken to Belmont Mansion in Fair-
mount Park, where a good time is an-
ticipated amid most beautiful surround-
ings and scenery. It is likely that some-
thing will be dug up yet for Saturday,
so don't anticipate going home too early.
The hotel committee has prepared a list
of hotels; printed on back of this list is
a map of the center of this city showing
location of hotels and prominent places.
Send a postal to the Florists' Club, Hor-
ticultural Hall, Broad below Locust, and
we will send you a copy. The Hotel
Walton, being next to the Broad street
theater, where the S. A. F. meetings will
be held, and opposite to the exhibition
hall, will practically be headquarters.

As regards the trade exhibit, the fol-
lowing firms have engaged space: Plants
—Henry A. Dreer, Inc., Joseph Heacock,
Chas. D. Ball, Robert Craig Company,
F. R. Pierson Company, Lemuel Ball,
and Wm. P. Craig.

Cut Flowers—John Lewis Childs,
Conard & Jones Company, Arthur Cowee,
W. W. Rawson Company.

Seedsman—Henry F. Michell Com-
pany, Arthur T. Boddington, and Henry
A. Dreer, Inc.

Flower Pots—Whilldin Pottery Com-
pany, and A. H. Hews Company.

mell & Downing, Bombayreed Manu-
facturing Company, and Daniel B. Long.

Trade Papers—Horticulture, The Flor-
ists' Exchange.
Advertising Signs—Leo Niessen Com-
pany, M. Rice & Company.

Others who wish space will be well
taken care of by DAVID RUST.

Baltimore, Md.

Trade Notes.

The average amount of Summer
business seems to be doing, but the hot
weather has had its effect on some of
the cut flower stock, which moves but
slowly.

About 20 members of the Gardeners'
Club had an enjoyable trip to Bay
Shore Park on Saturday evening last.
Several were accompanied by their fam-
ilies.

The bowling teams, of which there are
two, had several exciting games on the
Bay Shore alleys. The team under the
captaincy of I. H. Moss again tri-
umphed over the team captained by
McRichmond. All of the members made
good scores, and they hope to be there
with the goods at the S. A. F. meeting
and take a prize or two. C. L. S.

TERRE HAUTE, IND.—George
Hunt, florist, has been adjudged insane
and will be sent to the asylum as soon
as arrangements are made for his en-
trance. Mr. Hunt has been married four
years but has no children. He has been
afflicted with epilepsy several years, the
attacks gradually becoming more fre-
quent and severe. Recently, it is said,
he has been extremely violent.

Mr. Hunt is the son of the late la-
mented Myron A. Hunt, for many years
treasurer of the S. A. F., whose tragic
death was so greatly regretted, and all
in the trade will be grieved to learn of
the son's sad affliction.

NASHVILLE, TENN.—Jacques Geny,
an eccentric old Frenchman, who had for
years been a market gardener and florist
at the city market-house, died at a local
infirmary Tuesday morning July 16, 1907.
The old man was known among the chil-
dren of his neighborhood as a miser, who
lived with the dogs and cats and chick-
ens. He inherited the old Geny place
back of Vanderbilt University from his
aunt, and had accumulated considerable
other property besides, it is said. He
left no will so far as known, and the
disposition of his property is unknown.

FORTEN CENTS

you can get our instruction book containing a thousand ideas on how to build a modern greenhouse. It's of great value to everybody who has a greenhouse or is making repairs of any kind on one.

This book tells all about the construction and just how each and every piece is put together, even to the nailing of drip moulding on a wooden gutter. It is handsomely illustrated and you will find it a valuable book to have handy.

Answers all construction questions when building.

We will send a new catalogue with every instruction book if you write now.

Prices Advertised in these Columns are for

PERHAPS we didn't make it quite plain, the part the square shaft plays in that new encased self-oiling gear.

We made it square so that no matter what

you asked of it, light or heavy duty, there could be no slipping. The gear wheel has a square hole to take the shaft, and the pipe shafting is connected to it by this special coupling, bolted and riveted. When you consider that these gears move in reservoirs of oil it's plain enough they must work with great ease—and they do.

We have a circular devoted especially to this new gear. We want

you to write for it.

We make every part of a greenhouse but the glass—we sell any part.

Vol. XXIV. No. 5

NEW YORK AND CHICAGO, AUGUST 3, 1907

One Dollar Per Year

HYDRANGEAS

For Summer Blooming.

We have a magnificent lot of Hydrangea Otaksa grown especially for JULY AND AUGUST FLOWERING. The plants are just coming into bloom, just beginning to show color, and will be in perfection during July and August, when they are in great demand at watering places and other summer resorts. There is nothing showier or more satisfactory for lawn decoration. We make a specialty of them, and find an increasing demand for them from year to year. They can be shipped anywhere safely by freight.

Large plants in tubs, \$2.00 to \$3.00 each, according to size; Very large specimens, in half barrels, \$5.00 and \$7.50 each.

Prices will be cheerfully given to those applying to
F. W. O. SCHMITZ,
Prince Bay, N. Y.

PREPARE FOR CHRISTMAS

Novelties, always sell during the holidays. If you have not already grown
them, try some Pink or Rose Speciosums. If potted in July, will flower for Thank-
sgiving and Christmas. Always useful either for cut flowers or plants. Ask the
leading florists in Pittsburgh, Cleveland, Detroit, Buffalo, or around New York City.
Order to-day. Will ship any time.

Cold storage Liliun longiflorum take about two months to bloom from time
of potting; speciosums from five to six months, so that longiflorum wanted for
Thanksgiving and Christmas should be planted about Oct. 1, and speciosums in July.

All Cases are Re-packed Before Shipment

Liliun Longiflorum Multiflorum, 9 to 10-
in. bulbs, 200 in case, \$11.00 per 100;
\$100.00 per 1000.

Liliun Speciosum Rubrum, 8 to 9-in.
bulbs, 200 in case, \$8.00 per 100; \$75.00
per 1000; 9 to 11 in. bulbs, 150 in case,
\$12.50 per 100; \$110.00 per 1000.

Liliun Speciosum Melpomene, 8 to 9-in.
bulbs, 200 in case, \$9.00 per 100;
\$80.00 per 1000; 9 to 11-in. bulbs, 150
in case, \$12.00 per 100; \$115.00 per
1000.

Full cases sold at 1000 rate.

PANSY SEED

My Giant Market Pansies are from my own
Home Grown Seed of New Crop of 1907.

Price, mixed seed, 1/4 oz. \$1.00; 1 oz. \$2.75.

Plants ready Sept. 1st.

See what Mr. W. C. Ward of Quincy, Mass., says:
"Mr. E. A. Blinn: Dear Sir:—The Pansy Plants I
got of you last Fall were all that could be desired;
for size of flower and variety, of rich colors in the
strain, it would be hard to beat."

Also what Jos. Beach of So. Hadley Falls, Mass., says:
"The Pansy Plants that I got of you last Fall were
first class in every particular, plants as well as flow-
ers. I would never wish any better."

Seed Trade Report.

AMERICAN SEED TRADE ASSOCIATION

George S. Green, Chicago, Ill., president; M. H. Duryea, New York, first vice-president; F. W. Bolgiano, Washington, D. C., second vice-president; C. E. Kendel, Cleveland, O., secretary and treasurer; Leonard H. Vaughan, Chicago, assistant secretary.

During the calendar year of 1906 Rotterdam exported to the United States bulbs to the value of \$475,209; plants, \$305,076 and seeds of all kinds, \$151,907.

IMPORTS OF SEEDS, ETC.—July 23.—Peter Henderson & Company, five sacks radish seed; N. Y. & Cuba M. S. S. Company, one crate plants. July 26.—H. Nungesser & Company, 246 bags clover seed; Reed & Keller, 3 cases plants.

CANADIAN CLOVER SEED PROSPECTS.—The prospects for red clover seed in the neighborhood of Manilla, North Ontario, where large quantities of this crop are grown, are none too good this year. There is, however, every promise of a satisfactory yield of alsike.

BOONVILLE, IND.—Warwick county farmers fear another short crop of clover seed, owing, it is said, to the absence of bumble bees.

HOUSTON, TEX. — Reichardt & Schulte have secured additional contracts to furnish garden seeds for the State eleemosynary institutions, as given out by the State Purchasing Agent.

DES MOINES, IA.—The Iowa Seed Company's greenhouse at Thirty-first and Kingman avenue was struck by lightning during a recent storm. The chimney on the heating plant was entirely torn to pieces. The main part of the greenhouse was also struck and several of the company's books were burned in the office.

CHICAGO. This city leads the country in the higher grade onion set market and a careful survey of the situation places the acreage at not far from 1,100 acres this season with 70 per cent. of a normal crop as the estimated product though the weather of the immediate future may vary this proportion to some extent.

Charles Hollenbach returned Monday from the Michigan Lakes where he reports excellent fishing.

NEW YORK.—On Friday, July 26, the steamer Bermudian from Bermuda had on board large consignments of lily bulbs, among them the following: L. D. Cressmond & Company, 200 boxes and 472 cases; Wm. Elliott & Sons, 78 boxes; Peter Henderson & Company, 68 cases; W. Hagemann & Company, 242 cases; Middleton & Company, 55 cases; Charles F. Meyer, 67 boxes; Maltus & Ware, 86 boxes; Outerbridge & Company, 304 cases; F. R. Pierson Company, 172 cases; Vaughan's Seed Store, 645 cases; Weeber & Don, 37 cases; R. M. Ward & Company, 187 cases. To order, 1,656 boxes, 51 crates, 2 half-boxes and 16 cases.

Vaughan's Seed Store handled the past week two carloads of Bermuda lily bulbs. They report that the bulbs arrived in fine condition and are looking better than for several years.

LOUISVILLE, KY.—Writing regarding their recent loss by fire and water, Wood, Stubbs & Company state their plant was almost entirely covered by insurance; their financial loss will not be more than from \$1,000 to \$1,500, in addition to the temporary disarrangement of business and the destruction of some valuable lists. As recorded in last week's issue the firm has secured temporary quarters across the street from its former store, and intends locating permanently immediately so as to delay business as little as possible.

LXINGTON, KY.—The bluegrass seed crop of 1907 pooled with the Bluegrass Seed Growers' Association, a branch of the Society of Equity, was sold on July 20 at Winchester to David Gay, W. I. Spears and their associates. The sale comprised 200,000 bushels and embraces all of the bluegrass seed raised this year in Fayette, Clark, Madison, Montgomery and Bourbon counties. The price was private, but is said to be much larger than the bluegrass seed growers have realized in several years. The association was organized on June 24. R. S. Gay, of Clark, is president, and J. H. Halloway, of Clark, secretary. The directors are R. S. Gay, of Clark; Harvey Chenault, of Madison; Solomon Van Meter, of Fayette, and John Collins, of Bourbon.—Louisville Courier-Journal.

CLARINDA, IA.—W. C. Affeld has resigned his position as secretary of the A. A. Berry Seed Company to accept a position with a Chicago firm. He will leave Clarinda during the month of August, continuing, however, as a director of the company. Mr. Berry has also retired from the active management of the business, and F. R. McKee, who has been with the company since its incorporation, has accepted the position of manager. The board of directors are as follows: A. A. Berry, president; M. R. Ansbach, vice-president; A. F. Galloway, secretary and treasurer; F. R. McKee, manager; W. C. Affeld, George Standage and W. E. Whittaker.

European Notes.

At last we are fairly roasted, and are of course feeling correspondingly happy. Splendid weather every day (although we still have cool nights and cool and dull mornings) is improving our crops immensely. The brassicas appear to benefit the most, but parsnip, parsley and cress, that have given us some anxious hours, are showing up in fine style; carrot also is mending rapidly, and when we do get a few warm nights to perfect the work done during the day, all will be well.

If the acreage originally arranged for of the articles named above had survived, we could easily have filled our contracts in full, and carried over a small surplus.

MICHELL'S RELIABLE HOSE

Made especially for hard usage, ask most any florist about it.
3 ply per foot, 12c; 4 ply per foot, 14c.

Henry F. Michell Company
1018 Market St., Philadelphia

Our Advance Price List of Bulbs is ready.

It must not be forgotten that the favorable anticipations which twelve hours of bright sunshine have infused into our minds may have led us to "count our chickens before they are hatched," but as these notes simply purport to be "an abstract and brief chronicle of the time," your humble scribe will simply reply, "Sufficient unto the day is the evil thereof." *Verb. sap. sat.*

As regards flower seed, nasturtiums please us most, as a new crop of healthy leaves give us hope of a full half crop of seed if we get a fine Autumn. Pansy is now seeding moderately well, but a heavy batch of advance orders will clear off the greater part of the crop. Prices for this article are "away up."

Sweet peas are doing first rate, but the crop is still very uncertain. All the first blooms dropped without any seed being formed.

The bulb growers, both in Holland and England, are happy at last, and the anticipated delay in forwarding shipments, owing to delay in drying, may yet be avoided.

Recent callers include Albert McCullough and two daughters, of Cincinnati; Messrs. Annandale and Guthrie of the Steele, Briggs Seed Company, Toronto, and C. Johnson, of Marietta, Pa.

EUROPEAN SEEDS.

National Sweet Pea Society, England.

The seventh annual exhibition of this society was held in the Horticultural Hall, London, on July 16, and was a great success from every point of view. Owing to the very backward season it was feared that the blooms would not be ready, or not in good condition. The contrary proved to be the case, for a finer collection of sweet pea blossoms has never before been seen.

As regards the extent of the show itself every available room in the extensive block of buildings was filled to its utmost capacity, and many exhibits were left unstaged. There were 797 entries and 3,217 bunches in the competitive exhibits in addition to magnificent displays by Breadmore, Cannell, Carter, Dobbie, Eckford, King, Unwin, Veitch and other well known trade exhibitors.

The money taken at the doors was quite a record sum, and the trade exhibitors state that from their point of view the exhibition was the most satisfactory they have ever known.

As 202 new members have joined the society during the past year, and many more joined during the show, it is evident that the sweet pea cult is in a very healthy state on this side of the Atlantic.

Foreign visitors included Messrs. Burpee and Protin from the United States, Messrs. Benary, Jr., and Carl Schmit from Germany, and Count d'Etienne from France.

A very large number of novelties was submitted to the floral committee; of these the varieties named below were considered worthy of recognition. As no very startling novelty was brought forward, the society medal was not awarded, but as the floral committee has since visited the open ground trials at Reading, the members of it may have seen fit to recommend that such an award be made, and also to grant a sweet pea certificate in place of an award of merit.

The usual dinner was held at Fumagalli's in the evening, and when I state that W. Atlee Burpee, Esq., was the chairman, everyone will understand that a thoroughly enjoyable evening was the result. Further remarks on the new varieties must stand over for a few days.

An award of merit was recommended to the following varieties:

Elsie Herbert (Breadmore), large white standard, tinged with blush, wings expanded; a very fine flower.

Nancy Perkins (Perkins), an orange tinted Henry Eckford, nearly of the Countess form.

Silas Cole (Cole), very large flower of the Countess type; color very similar to that of Duke of Westminster.

St. George (Dobbie), a splendid variety exhibited by Hurst & Son last year as Queen of Spain. A giant form of Evelyn Byatt, with a more glowing orange scarlet in the standard. The best of this class in every respect.

Rosie Adams (Stevenson), a deep mauve, similar to the dark flowers in Mrs. Walter Wright; true Countess form.

Evelyn Hemus (Hemus), creamy buff, picotee edged, Countess form.

The Marquis (Dobbie), Countess form a bright rosy mauve; a grand flower well worthy of the award.

S. B. Dicks, F. R. H. S.

The Fordhook Farm Trial Grounds.

The present season is proving much better than the last year for the trials of vegetables and flower seeds, at the Burpee farm, Fordhook, Doylestown, Pa. The late Spring retarded the sowing of many things, but a good growing season has followed which is bringing results. Most of the crops are yet three weeks behind the average season. Usually at this time of year some crops have covered the ground so that the cultivators had to be stopped, but this year cultivating will go on at least three weeks longer.

Sweet Peas.

Sweet pea trials have been very good this year; the greatest interest now seems centered in those varieties of the Countess Spencer family. This type has given much satisfaction, and no doubt all the varieties that have sprung from it will be in great demand. We cannot go all through the list, so give a few of the best that caught our eye:

Helon Lewis, a salmon pink very free; John Ingman, bright pink, this is a great favorite with the experts; Phyllis Unwin, bright pink, a good addition.

Of the English introductions of 1906, which last year owing to the unfavorable season, could not be passed upon, we saw some very good additions. Beacon, very much like Blanche Ferry, if anything rather lighter, is a very free bloomer, and a most desirable variety. Albion, flesh color, is a very pretty flower. Cyril Breadmore, cerise pink, of good growth, is very desirable for a collection. Albatross, white, throws a small flower, but is very prolific, and makes a splendid show in the row. Flora Norton and Mrs. Philbrick are the best introductions in a long time, especially for florists; they are pure lavender in color. All the lavender varieties we now have show some pink in them, more so when grown under glass, hence these new ones are just what the florist has been looking for. Mrs. Philbrick, in addition to being of the true color, makes a very good growth.

Other very noticeable varieties were Burpee's Unique, a striped flower, very good in a collection. White Countess, also very good; Mrs. Charles Foster, a reddish mauve; Midnight, maroon and purple, very distinct and should be largely grown.

Of Eckford's last introductions, he certainly gave a good one in Queen Alexandra, a pure scarlet; a wonderful improvement over any existing varieties.

Bolton's Pink, is a large flower and stands the sun very well. Othello is yet the best dark variety. Prima Donna is the best pink; and for a florist's white there is yet nothing to surpass Dorothy Eckford; it has a long stem and large flower, and bunches extremely well. White Wonder is a new white which florists would do well to try; it has a long stem, good pure white flower, and many of the blooms come double, so that it is very desirable for bunching.

Other Interesting Stock.

Among other things interesting to florists are the variegated Tom Thumb nasturtiums; these are most desirable for window boxes, etc. One variety, Crystal Sunshine, is marked just like Italian marble; it is very distinct and perfect. Queen of Tropaeolums has a variegated leaf marked like marble, and produces dark red flowers. The variegated ivy-leaved nasturtiums, with clean yellow flowers, are also very desirable.

In our tramp around the farm we saw large blocks of phlox, also Nicotiana Sanderae grown in separate colors; these are very desirable and should be more grown.

The entire farm and trial grounds are in perfect order, and any members of the trade who while at the S. A. F. convention care to take a trip to the farms, will be made perfectly welcome, and will be sure to see some things which will benefit them and pay them fourfold for the trip.

BODDINGTON'S CHRISTMAS SWEET PEAS

BODDINGTON'S EXTRA-EARLY CHRISTMAS WHITE SNOWBIRD. An exceptionally early Sweet Pea for indoor flowering—will bloom six weeks after sowing. Color clear white upon long stems; habit fairly dwarf, and of exceptionally free flowering qualities. Trade pkts. 50c., 1 lb. \$1.50, 1 lb. \$2.50.

CANARY. Similar to the above, but flowers of an exceptionally good yellow. Trade pkts. 50c., 1 lb. \$1.50, 1 lb. \$2.50.

FLAMINGO. Color scarlet; free-flowering and early. As the crop of this variety was small, we can only send out packets this season for trial. Pkt. 25 cts., 5 packets for \$1.

BODDINGTON'S CHRISTMAS PINK. This is the earliest and most profitable and useful Sweet Pea in cultivation as by sowing the seed under glass in latter part of August, flowers can be cut from Thanksgiving on during the winter months. 1 lb. 30 cts., 1 lb. 50 cts., 1 lb. 75 cts.

BODDINGTON'S CHRISTMAS WHITE. A companion to Christmas Pink. Just as free and profuse a bloomer, and is, without doubt, the finest early white for indoor planting. 1 lb. 30 cts., 1 lb. 50 cts., 1 lb. 75 cts.

Our Fall Bulb Catalogue now ready, if you have not already secured one—send a postcard today. Besides a full collection of seeds for fall sowing it contains a list of over

Two Hundred Varieties of Perennial Seeds

that can be sown now.

Plant Notes.

SELAGINELLA WATSONI.—One of the best varieties of selaginella for making up in pans is *S. Watsoni*. It grows freely and quickly after getting established in the soil. As a cutting it can hardly be called a cutting, because every piece has sufficient roots to sustain it when severed from the main plant. After they are grown for some time in small pots three or more may be put in a shallow pan, where in a very little while they will form into a shapely and luxuriant specimen well fitted for many purposes.

ARALIA VEITCHII.—One of the handsomest of the aralias is *A. Veitchii*, which is hard to beat as a choice plant for room or table decoration under moderately favorable conditions. Aralias, this variety in particular, should not be left very long in the ordinary dwelling house atmosphere, but should after a few days be removed and sponged carefully and placed again in a moist growing atmosphere such as a warm greenhouse affords.

HELICONIAS are not commonly grown commercially for dwelling house decoration, being chiefly used for the ornamentation of conservatories and greenhouses. They are occasionally made use of by florists in their business, and when well grown thrifty plants are used they make a pleasing change by their rich foliage and soft coloring from many of the plants ordinarily employed. Heliconias are much bothered by scale, but if the foliage is sponged frequently they are not very hard to keep in fairly good condition.

CURMERIA PICTURATA is a very bright showy plant with beautiful dark green foliage liberally spotted or blotched with a clear, clean white. This plant is just as easily grown as a maranta or diffenbachia, while it can be used to fully as much advantage and with as much effect as either. It will make a bright cheerful little specimen in very little time fitted for baskets or dishes indoors.

CROTONS should now be making rapid and luxuriant growth, and if it is desirable to keep the plants growing as long as possible and there being no hurry to get them into color, a shift will benefit young vigorous plants whenever the condition of the roots warrant larger quarters for increased growth. When crotons are given plenty of water whenever they require it there is no need of shading the glass to protect the young growths, but when these growths are very soft and the roots of the plants cramped for room, if they are allowed to get dry they will quickly show its effects in flagging foliage. An immediate application of water will remedy matters quite satisfactorily. However, it is doubtful if many hard wooded plants are much benefited by the addition of manure to the soil in which they are potted at any stage of their growth. I think most of such plants, including crotons, get along better without any manure or leafmold, using good turfy loam principally. When however, hard wooded plants are of necessity confined, as far as their roots are concerned, to small pots, the soil in which is closely matted with these life-giving and life-sustaining agents, liquid manure carefully and moderately administered is the only way by which the plants can be kept flourishing while their roots are so confined. Manure water applied to plants over potted or newly potted is harmful instead of beneficial; it is also the same when applied to plants not in active growing condition. Manure water applied carefully to crotons when they are in the pots in which they are to remain permanently will help the plants to hold all their leaves and also aid in bringing out vivid coloring in the foliage.

D. M.

A RECORD BREAKER

GODFREY ASCHMANN of Philadelphia, the
Well-known Araucaria Specialist of America

Watch Us Grow

1907 is now the twelfth year of our anniversary in a successful career in the importation, growing and shipping of that well-known and much admired evergreen decorative plant, the *Araucaria Excelsa*, *Compacta*, *Robusta* and the *Glaucæ*. Beginning with the first year (1895) with an importation of 100, this year (Spring 1907) our importation has swollen up to the enormous quantity of 6,000 in the well-known, three best varieties, the *Araucaria Excelsa*, *Compacta*, *Robusta* and the *Glaucæ*. Our *Araucarias* are so well introduced that at the present time they represent every city, county and state of America, so far as Cuba and Mexico, and from the Atlantic to the Pacific Ocean. It is always my earnest desire to improve my system in buying, raising, selling and shipping our production to such an extent, that it not only benefits ourselves, but so that it will yield a fair profit into the pockets of our buyers. Now is your chance and the time to fill your empty houses and make money fast, as the plants will grow into money while you sleep.

ARAUCARIA Excelsa, 5 in. pots, 10-12 in. high, 2 tiers, 2 years old, 60c. each; larger sizes, 5-6½ and 6 in. pots, 2-3-4 years old, 60c.-75c.-\$1.00 to \$1.25 each.
ARAUCARIA Compacta Robusta, 6 in. pots, 2-2-4 years old, 10-12-16 to 18 inches high, 3 to 4 tiers, \$1.00-\$1.25-\$1.50-\$1.75 to \$2.00 each.
ARAUCARIA Glaucæ, 2-4-5 tiers, 2-3-4 years old, 10-12-15-18 to 20 in. high, 6

Please state if plants are to be shipped with or without the pots.

NURSERY DEPARTMENT.

Conducted by Joseph Meehan.

AMERICAN ASSOCIATION OF NURSEYRMEN.
J. W. Hill, Des Moines, Ia., president; C. M. Hobbs, Bridgeport, Ind., vice-president; George C. Seager, Rochester, N. Y., secretary; C. L. Yates, Rochester, N. Y., treasurer.

Recent bulletins of interest to nurserymen are the following: "Bordeaux Injury," bulletin 288 New York Experiment Station, Geneva; "The Effect of Wood Ashes and Acid Phosphate on the Yield and Color of Apples," bulletin 289 of the same Station.

NEW NURSERY LAW FOR WISCONSIN.—A new law has just been passed which will be of interest both to nurserymen and to persons buying nursery stock. It provides for uniform inspection by the agricultural experiment station of the State University of all nurseries growing and offering stock for sale in the State, such inspection being for the purpose of determining whether or not the nurseries are free from dangerous fungous and insect pests. In the past this has been optional with the nurserymen, but hereafter all nurseries must be inspected. Parties who are growing plants for sale, other than greenhouse plants, should make application at once for inspection to J. G. Moore, Inspector, Experiment Station, Madison, Wis. If the inspecting is done during the regular inspection season the cost will be much less than where done out of season.

NOTABLE GATHERING OF POMOLOGISTS AT JAMESTOWN IN SEPTEMBER, 1907.—Arrangements have been perfected whereby a congress of horticulturists will occur at Jamestown at the time, or near the time, of the American Pomological Society meeting, September 24-26. Immediately preceding it will occur the meeting of the Society for Horticultural Science and the Maryland State Horticultural Society. Immediately following, with the first session beginning on September 26, will occur the convention of the National Nut Growers. This combination of horticultural events will assure the largest gathering of horticulturists the country has seen since the days of the World's Fair at Chicago.

The program of the Pomological Society is well nigh completed. In addition to the leaders in scientific research in pomology and the prominent orchardists of this country, the Pomological Society will be favored with representatives from Britain and Europe. Delegates from the Royal Horticultural Society of England, the National Society of France and leading fruit growers and plantmen of Germany are expected. All fruit growers who expect to visit Jamestown should plan to attend this great series of meetings. The heated period will be over by that time, and numerous attractions should conspire to make the occasion one of pleasure and profit.

For further information apply to John Craig, Ithaca, N. Y., secretary, or L. A. Goodman, Kansas City, Mo., president.

Flowering Branch of Oxydendron Arboreum

Oxydendron Arboreum.

A rare tree in collections, yet one that is abundant in its native wilds, is the Oxydendron arboreum. In many catalogues this tree is still carried under its very old name, *Andromeda arborea*, but Oxydendron is the correct one. Many native trees are scarce in collections for the simple reason that nurserymen have made no efforts to obtain a supply. When asked why, they say they have no call for such things. They have not, but it is only because they have put forth no endeavor to make them known. This was the case in the past with the Oxydendron. It is not so now, for it has been brought to the front prominently within late years, and now that specimens are growing up to flowering size, there is a better knowledge of its merits.

The illustration accompanying these notes is of a tree in Germantown, Philadelphia, one of several hundred which were distributed from Philadelphia nurseries many years ago. It is now a tree of about 30 feet in height, and one of the very best in this vicinity. It is very attractive when in flower, as our specimen was when it was photographed. The numerous panicles made the tree most attractive, but that the beauty of the flowers might be better perceived we had a photograph taken of a single panicle as well.

The tree is quite hardy in the Middle States. In fact, it is native of Ohio as well as farther South, growing along the Alleghany Mountains from Ohio through Pennsylvania, Virginia and through the South as far as Florida. The one pictured came originally from the mountains of Virginia, where the tree is very abundant, and where the cold is as intense as it is where the tree now grows.

In addition to the beauty of its flowers a great deal of its fame comes from its foliage, which changes to a bright crimson in Autumn, somewhat as does the sour gum, but not as deep a crimson.

When young, the tree is apt to become of a bushy habit, failing to make a leader, especially if pruned hard on transplanting. Usually the tree shape is preferred, but the tree may grow up as the one illustrated has done. When this is desired it can often be brought about by cutting down neatly to the ground one that is bushy, which will cause it to make one or more strong shoots, when all but the strongest should be cut away. It has been noticed that the tree has a habit of making a strong leader at times, even when growing as a bush, so that with a little assistance, as suggested, it is not difficult to get a tree shape.

Horticultural Notes.

A writer from Fishkill, N. Y., states that *Aspidistra lurida* lives out there or has lived out one Winter, and asks if its hardiness is known. It has lived out in Philadelphia in protected places and has been killed in exposed ones. When well covered with leaves or litter it will survive here.

A correspondent writes that on purchasing a cinnamon vine he found when Summer came, bringing a strong growth on plants, that he had bought an old acquaintance of his garden, the *Dioscorea Batatas*, the Chinese "am." It is called the cinnamon vine.

If the heads of *Erianthus Ravenna* are cut before well out of their sheaths and hung head downward, they are said to become so white and pretty as to be very ornamental.

Pecan nuts are reported indigenous to Virginia, but botanics give Mottezuma, Indiana, as its northern limit. It is a hardy tree at least to New York City.

It is no wonder the caragana is classed as "hardy everywhere," as it is in some catalogues, when it withstands 45 degrees below zero in Manitoba.

Grafted globe Arbor vitas are occasionally seen,

can be increased by layering or inarching, it adds: "Both operations require great care and a considerable amount of patience, for layers will take three years before they are sufficiently rooted to separate

Oxydendron Arboreum (*Andromeda Arborea*)

the common globe form, *Thuja globosa*, being grafted on the parent form, *Thuja occidentalis*. But unless the stock is very thick and strong the combination is not a success, the heaviness of the globe head causing the swaying to one side of the stock.

Spiraea Regeliana has compressed panicles of light pink flowers which are displayed in July, and often some blooms appear quite late in September. It is one of the best of pink flowering spiraeas for Summer use and it is one of those that root freely from cuttings of either hard wood in Spring or soft wood in Summer.

Layering Magnolias.

How methods differ is shown by quoting from an answer made to an inquiry by *Gardening Illustrated*, relating to increasing magnolias. After saying they from the parent plant. The layers may be put down at any time, but the Autumn is best for the purpose."

The practice of our propagators is to put down the layers just as soon as the shoots are of sufficient length to permit of this being done, which is in June or July. Then it is found that two seasons are ample for the rooting; in fact, some take up the layers after one year, but two years is better for the young plants.

In the case of *Magnolia grandiflora*, the evergreen one of the South, longer time may be allowed for rooting, on account of its evergreen character, which makes it demand more care in handling; and when finally severed from the parent stock the greater number of its leaves should be cut off at the same time.

THE TRADE ONLY—When Writing Please Mention
THE FLORISTS' EXCHANGE.

St. Paul.

News Notes.

The furniture and fixtures, also stock of florists' supplies, belonging to Colberg & Lemke, were sold to the highest bidder the past week. The icebox which cost between \$300 and \$400, was sold for \$85; a few marble top counters that cost at least \$30 or \$40 apiece were sold for \$7 each and such small prices seemed to prevail on about all of the stock. Fine novelty baskets were practically sold for a song.

A report is going the rounds that we are to have a new florist this Fall; the Golden Rule department store will open a cutflower department.

The florists have accepted the invitation of L. L. May to hold their picnic at his Summer home at Mayfield. The firm's large nurseries are there and it will no doubt be of interest to the trade to make a thorough investigation and learn of the careful manner in which the stock is grown also the magnitude of the place. Mr. May has arranged to have them all transported from the railway station by carriages, automobiles, wagons and so forth, and arrangements have been made for dancing, games, etc. The affair will be held August 8.

Chas. Vogt, P. Holm, H. Puvogel, Carl Hagen and W. Clarine spent a week fishing at Dent, Minn. Emil Helwig, who has been in and out of the florist business for some time, and who is now running a Summer hotel, entertained them royally. PAUL.

Herbaceous Border Notes.

At this season there are generally quantities of flowers of yellow color, for there are so many varieties of sunflowers, rudbeckias, silphiums, etc., that bloom at this time that the greatest care is necessary in planting or else there will be a lack of harmony and the border will in the main look as a mass of yellow. There are many of these yellow flowers that are fine, just the same, and as many of them are tall growing, they may be used to advantage in the background, especially if their color effect is broken by other tall growing plants like *Bocconia cordata* or some of the boltonias.

There are many fine colors among the hollyhocks at the present time, and the single flowered varieties seem to be much more in use than the double ones. This is on account of their being less subject to disease than the double forms. These old-fashioned flowers should be more extensively grown than they are.

Many of the hybrid delphiniums are still in bloom. We recently saw a collection which was very fine indeed, but they were all named varieties. Delphinium chinensis is beautiful in color and the white form is very good. Delphinium Zalil is a yellow species which should always be grown and although its foliage may not be very pleasing its sulphur yellow flowers are very imposing. Delphinium sibiricum is of a beautiful shade of dark blue; it is quite distinct. Delphinium bella donna is a light blue variety which is very good.

The platycodons, or Japanese bellflowers, are now in their full glory, and what fine flowers they are! The grandiflora varieties, both blue and white, are excellent and useful for cutting purposes, but the dwarf growing variety, *Mariesi*, is the most free flowering and best of all the varieties.

Some of the spiraeas are now very showy; the rather rare variety, *chinensis*, with its beautiful pink flowers, is one of the best. Then there is *palmata*, both white and crimson, which is good. *Spiraea lobata*, with its fine heads of pink flowers, I consider one of the best; this plant is now generally known as *ulmaria rubra*.

Stokesia cyanea is one of the finest border plants now in bloom; it is of a beautiful lavender blue shade and much like an aster. There is a white form which is rather rare, but which is equally as fine as the blue.

The helianthus are now in full bloom. Almost every one knows the variety *pumilus*, but there is an improvement on it known as *magnificum*, and there is a very dark flowered variety called *cupreum* which is the darkest colored one we have seen.

There are several of the silphiums which may be grown, but they are tall, rather coarse growing, and may only be used in the background as already mentioned, or in the shrubbery.

Heliopsis laevis is very good when it comes out fresh, and if cut back after the first flowers have passed will soon grow again.

Among the rudbeckias now in flower, I like *submontana* the best, but speciosa, or as it is often called *Newmanni*, is good and so is *triloba*. *Rudbeckia laciniata* flore pleno, or as it is commonly known *Golden Glow*, is a tall growing plant and very useful for cutting purposes, for the flowers are of a free appearing habit which always commends them.

Eryngium Oliverianum is one of the best colored varieties of this plant that we know. It is now in full flower.

Some of the veronicas are now in bloom; one of the prettiest is *V. longifolia rosea*. This plant has a pretty heath-like appearance which commends it. Then there is the best of all the varieties, with its deep blue flowers—*longifolia subsessilis*. *Veronica incana* is also good.

The funkias are late blooming plants which are just becoming showy; *caerulea* is very fine at present and so is *lanceifolia*.

Lintris spicata and *scariosa* the blazing star, are just getting showy, but the best of all the varieties is *pyncostachya*, spikes of which, several feet in length when cut, are very fine.

Malva moschata and *alba* are now very pretty in the border and so is *M. alcea*.

Some of the *hemerocallis* are still

throwing abundance of flowers, that pretty yellow variety, *Thunbergii*, being very fine indeed.

There is a rather pretty border plant now in full flower known as the mosquito plant, from the fact that the blossoms will catch these insects. It is named *Cynanchum acuminatifolium*.

If the ruccas are used in the border they will be now very showy with their large heads of white flowers.

The hybrid phloxes are beginning to be very fine; so far there has only been some of the earlier sorts in bloom, but now the variety is greater and they add materially to the wealth of colors that help to brighten up the dry season of late Summer.

Boston, Mass.

CANASTOTA, N. Y.—Arthur C. Hess, who has been appointed administrator of the estate of his father, the late Marvin M. Hess, has decided to close the grocery, which has been conducted in the Booklet Block for many years. He will, however, continue the seed business conducted by his father, utilizing the Hess premises in East Center street.

NOTICE is hereby given that any concern having orders given by James Young of Hartford, Conn., to please countermand the same on account of Mr. Young's death. WM. YOUNG, Wethersfield, Conn.

Gardeners and Florists' Club Picnic.

The annual Summer outing and picnic of the Gardeners and Florists' Club, which was held on Thursday, July 25, in Dorchester Park, was by far the most successful in the history of the organization. There were about two hundred and fifty present, and young and old alike took part in the celebrations of the day. Dorchester Park is an ideal picnic grove. The committee in charge, which was composed of Duncan Finlayson, chairman; K. Cameron, R. S. Edgar, M. Fuld, W. Downs, James Wheeler, Wilfred Wheeler, Peter Miller, H. M. Robinson and J. W. Duncan, had arrangements so perfected that everything went through without a hitch; even the weather man gave a favorable day, only supplying enough rain in time to lay the dust at the end of the festivities.

The most exciting events were the baseball game and tug of war between the private gardeners and commercial men. In the ball game the private growers, under the leadership of James Wheeler, beat the commercial men led by Fred Palmer, the score being 7 to 6. The private men under the leadership of James Wheeler beat the commercial men led by W. J. Collins, in the tug of war.

In the quilt match the winners were W. Robb, J. McKenzie and F. Coles.

The list of other events was as follows:

One Hundred Yard Race, boys under 15—First, Wm. Iliffe; second, Geo. Palmer; third, Thos. Westwood.

One Hundred Yard Race, girls under 15—First, Florence Lumsden; second, Harriet Coles; third, Florence Eisenhardt.

Fifty Yard Race, married ladies—First, Mrs. Robert Edgar; second, Mrs. Daniel Whyte.

Fifty Yard Race, boys under 7—First, J. McKenzie; second, Willie Westwood; third, Charles Clark.

Fifty Yard Race, girls under 7—First, Edith Iliffe; second, Marjorie Iliffe; third, Ruth Cartwright.

One Hundred Yard Race, ladies over 16—First, Louise Eisenhardt; second, Anna Robb; third, Jean Westwood.

Two Hundred Yard Race, boys under 15—First, Wm. Iliffe; second, Thomas Westwood; third, Geo. Palmer.

Ladies' Potato Race—First, Catherine Lally; second, Jean Westwood.

Throwing baseball—First, Carroll Davis, 266 feet 11 inches; second, A. E. Walsh, 258 feet 3 inches.

One Hundred Yards Handicap—First, Carroll Davis; second, J. S. Brown; third, A. E. Walsh.

Throwing tennis ball for ladies—First, Harriet Coles; second, Florence Eisenhardt; third, Florence Palmer.

Throwing 16 pound shot—First, W. S. Grassie, 30 feet 1 inch; second, John Reid, 29 feet 5 inches.

Long jump—First, G. H. Grey, 16 feet 5 inches; second, W. J. Collins, 16 feet 2 inches.

One-Half mile race—First, J. S. Brown; second, J. Reid; third, G. H. Grey.

Three-legged race—First, W. J. Collins and J. Reid; second, J. S. Brown and Fred Coles.

Sack race for boys—First, Thos. Westwood; second, J. Lissou; third, Geo. Palmer.

Sack race for men—First, W. J. Collins; second, Wm. S. Grassie.

High jump—First, W. S. Grassie, 5 feet 1 inch; second, F. Edgar.

Fat men's race—First, James, Wheeler; second, A. Zirngiebel; third, J. L. Miller.

240-Yard handicap—First, G. H. Grey; second, A. E. Walsh; third, J. S. Brown.

Potato race, for girls under 15—First, Helen Vears; second, Lillian Vears.

Potato race, for boys—First, Robt. Smith; second, Charles Clark; third, W. McGorum.

In the baseball for boys Iliffe's team beat Andrews'.

After the events the prizes, which were composed of many useful articles, were presented. These prizes were contributed by many of the leading firms in the locality connected with the trade.

Visit to Rawson's Sweet Pea Fields.

About fifty of the craft interested in the sweet pea accepted the invitation of W. W. Rawson & Company and spent Saturday afternoon at his trial grounds at Marblehead, having been carried there by special car provided by their host. At these grounds nearly 1,000 varieties of dahlias are being tried and a large number of sweet peas. One of the features of the meeting was the voting contest on the best varieties as seen at these grounds. The result was as follows:

lows for the best twelve sorts; Frank Dolby 38, Nora Unwin 32, Queen Alexandra 30, George Herbert 28, Miss Willmott 28, Apple Blossom 26, Flora Norton 22, Mrs. Alfred Watkins 22, White Wonder 20, Zoe 20, Shasta 18, and Admiration 18. Lunch was served in a tent on the lawn, Maurice Fuld being master of ceremonies; afterwards the younger element engaged in a game of ball. The return trip was made in the evening by special car.

News Jottings.

J. T. Butterworth and daughter Rachel sailed on Tuesday of last week for a few weeks well earned vacation in Europe.

William Sim has his place almost entirely devoted to tomato growing at this season. He has adopted the same plan of growing outdoors as he does inside and although the labor is much greater the results are so much better that it pays well. He has recently perfected a watering system whereby he waters his whole place from the manure tank or with clear water as desired. His violets in the field look well and bid fair to take their usual place as leaders in the market next season.

Jos. Margolis of H. M. Robinson & Company has returned from a three weeks' visit in Maine.

D. F. Roy of Malden has gone to Belvidere, N. J. to spend a few weeks.

Wm. McAlpin of the J. A. Budlong & Sons Company has gone to Philadelphia for a brief vacation.

Duncan A. Robertson and wife are here from Chicago to spend a few weeks visiting friends.

It is doubtful yet what the size of the Boston delegation to the Philadelphia convention will be, but it is safe to say that it will be larger than for several years.

J. W. DUNCAN.

Newport, R. I.

News and Trade Notes.

A week of very hot weather had a somewhat hindering effect on those inclined and able to give large and costly entertainments. There are always a few of these given in the last days of July, but they do not come thick and fast until the second and third week in August; it is then or never (for the season at least), that opportunities arise for florists to take immediate advantage of.

A week or two ago I mentioned in these columns that members of the inner circle of select society occasionally place costly flowers and plants upon the graves of departed canine favorites. This week society was all in a flutter of excitement in expectation of a visit from "Sultan," an educated monkey. He arrived in due time accompanied by a valet from Boston's establishment. He dined at Belcourt at a table decorated with the costliest flowers. His monkeyship is reported to have glanced very frequently in delighted approval at the exquisite floral embellishments of the table at intervals, while partaking with becoming grace and dignity of the costly viands provided for him and shared with him by his host and hostess. "Sultan" wore a gardenia in his buttonhole and smoked a cigarette while emerging from the mansion to enter the awaiting automobile which was to convey him and his attendant to Narragansett Pier, where more hospitality and favor awaited him.

At a dinner given a few evenings ago by Mr. E. T. Gerry the table decorations were very effective; they consisted of American Beauty and Crimson Rambler roses; the small flowers of the latter worked in charmingly with the former, and their combined effect was very favorably commented upon.

Mr. and Mrs. Wm. B. Leeds contemplate a house warming on an unusually grand scale, and it is understood that Mr. Smythe is already at work thinking out an elaborate scheme of floral decorations.

V. A. Vanicek of the Rhode Island Nurseries is still engaged in planting evergreens on private estates. Mr. Vanicek has just received a large order from Wadley & Smythe for the restocking of the Newport Nursery with choice evergreens of small size.

The demand for English ivy in the Spring has had the effect of a rush by growers to wherever ivy cuttings can be obtained; every one is eagerly picked up as soon as cut, by private gardeners.

No S. A. F. Souvenir Book this Year.

The Philadelphia Florists' Club has decided not to issue a Souvenir Book in connection with the coming convention of the S. A. F. O. H., but will rely upon its own resources in securing the funds necessary for all disbursements associated with the occasion. This will be welcome news to the trade generally, who have been importuned to quite an extent in recent years for advertisements in the Souvenir to help defray S. A. F. convention expenses.

The souvenir business it seems was somewhat overdone, and the benefit received by advertisers in the publication not adequate to the rates charged. In addition to that, the book has on several occasions been "farmed out" on a speculative basis, particularly in the line of securing advertising business, one or two persons reaping a profit from the proceeds, which were intended to help along the craft entertaining the delegates in the convention city, purely and simply. It was never the intention, as we understand it, that outsiders should be beneficiaries in the publication of convention souvenirs; and in some cities, for example, New York, the local members willingly gave their services, arduous enough surely, gratis for the general benefit. When these publications become money-making ventures for a few individuals, whose interest in the work is selfish rather than altruistic, their cessation is commendable; and the Philadelphia Florists' Club has, we think, set an excellent example in this matter, which future convention cities would do well to pattern after. Your own hospitality, provided by your own money, whether extensive or limited, given heartily and with a good will, is all the more appreciated, and demonstrates independence of a character that is at all times praiseworthy.

IDEALITE, the journal published by the Ideal Concrete & Machinery Company, South Bend, Ind., announces as a prize competition for premiums amounting to \$200, to be awarded to the firm's customers for photographs which may be approved by a committee consisting of an architect, a contractor and builder, and an officer of the Ideal Company, which represent the best and most artistic construction built of "Ideal" concrete blocks. Those interested in the contest should write to the concern for blanks setting forth the conditions of the competition.

BOOKS RECEIVED.

THE FORAGE AND FIBER CROPS IN AMERICA.—By Thomas F. Hunt, M. S., D. Agr., Professor of Agronomy in the New York State College of Agriculture at Cornell University. Orange Judd Company, New York, publishers. Cloth. Price, \$1.75.

This is a book for the farmer, the teacher, and the college student. It has been prepared with the view to meeting the demand for an untechnical but scientific and comprehensive treatise of the grasses, legumes, and fibers. The method of presentation is similar to that of "The Cereals in America" to which book this is proposed as a companion, the two volumes together purporting to furnish a year's work in a college course in agronomy. The volume is admirably adapted to general reading and will undoubtedly take its place among the few handbooks on agricultural topics. To timothy, Kentucky blue grass, red clover, alfalfa, cowpeas and cotton has been given the same plain, thoughtful, and accurate treatment which characterizes "The Cereals in America."

In these days when the United States Government and others have become excited over the alleged adulteration of seeds of certain forage crops, it is natural that the author should bestow some attention on that subject, and he does. Regarding "Impurities" he says: "These may consist of three classes: (1) inert matter; (2) weed seeds, and (3) foreign but useful seeds. Impurities may be accidental—namely, due to the imperfection of cleaning machinery and to the occurrence of weeds or cultivated plants in the crop when harvested. Adulterants or foreign bodies artificially added for gain may consist of inert bodies—such as colored stones in red clover seed, or seeds of plants of greater or less usefulness but of less cost per pound—such as black medic seed in red clover, Canada blue grass for Kentucky blue grass, and perennial rye grass for meadow fescue seed. In some cases complete substitution is made. In general, grass seeds have not been subject to a great deal of adulteration. The purpose of many lawn grass mixtures, however, is to substitute lower priced for higher priced seeds. Alfalfa and clover seeds have been rather more subject to adulteration. The most important impurities are noxious weed seeds, their injurious quality being due to the kinds rather than the quantities of seeds present. A great deal of seed placed on the market is of low germinating power."

While the foregoing statements may be correct to some extent, we think in the main they are too sweeping, and their inclusion in a work of this kind is bound to have a more or less harmful effect, creating, as the statements are bound to do, in the mind of the reader suspicion and lack of confidence in those handling seeds of the nature referred to. Candidly, we think, on account of their non-specific and altogether too general character, it would have been better for all concerned had they been omitted. It is conceded by all fairminded people who know the seed trade, that the men engaged in that industry are just as free from dishonest practices as are the majority of other tradesmen, and it is unfair to besmirch the reputation of the whole for the faults of a probable few. But perhaps, Professor Hunt's aim was to show how easily such fraud could be accomplished; and in that way perpetuate rather than curb the alleged custom complained of. In this way his exposé of it will do more harm than good.

However, taken as a whole, the volume is an excellent and useful one for the purposes of those for whom it is intended. An abundance of new and scientific thought has been crowded into its pages; and the author, in addition to his own knowledge of the subjects dealt with, has drawn largely from all available sources for the best information procurable. Reproduction in grasses, permanency in meadows and pastures, the role of legumes in soil inoculation, the production of root crops as a substitute for the more expensive concentrates, fiber crops in their economic relations are some of the salient features. Laboratory exercises are provided, and ample collateral reading is supplied at the end of each chapter. More than 150 illustrations, prepared by B. F. Williamson, illuminate the text.

Copies of the work can be obtained through The Florists' Exchange at the price named—\$1.75.

American Rose Society.

A meeting of the executive committee of the American Rose Society was held Wednesday, July 24, at Hotel Martinique, New York. All members, including the members-elect, were notified and a general response to the call followed. Before the meeting were three particular things, namely, final decision was made as to the character of the certificate to be awarded for novelties in addition to the gold and silver medals now offered; specimens of certificates were presented and one was decided upon, which will be worth having and preserving, also a certificate for life membership. There is a life membership fund now invested, amounting to \$2,700.

Mr. Breitmeyer suggested that a committee be appointed to solicit life memberships because the Rose Society, to do the work which it can do, in creating a popular sentiment for the rose, and interest in the planting and growing of the same, needs permanent endowment of sufficient amount to enable it to be an organization of vital and permanent force and with this end in view, President Simpson appointed the following members to take up the matter of soliciting life members: Philip Breitmeyer, Detroit, Mich.; August Poelmann, Morton Grove, Ill.; Patrick Welch, Boston, Mass.; P. J. Lynch, West Grove, Pa., and Adolph Farenwald, Hillside, Pa.

Mr. Hill reported on behalf of the E. G. Hill Company that they would offer \$50 in a prize or prizes, as the committee may designate, for the Chicago show next Spring. Mr. Hill added that the splendid offers of Philip Breitmeyer and A. T. Boddington ought to bring out a fine lot of exhibits and urged that an effort be made to secure an exhibit of roses in pots, of all the novelties, European and others.

President Simpson advised that the attention of all rose growers, and especially private gardeners, be directed to the offers made by Messrs. Breitmeyer and Boddington; the former offers \$200 and the latter \$100 as first and second prizes for best exhibit of outdoor roses in pots, in bloom, the exhibit to consist of 150 plants, not more than five plants of one variety, correctly labeled, and to include all classes of roses suitable for outdoor planting.

The officers of the American Rose Society are very much gratified at being able to offer such splendid premiums and hope that a goodly number of growers will enter the list of competitors and, as a result, we may have the finest display of outdoor roses in Chicago, next March, that has ever been made before the society. It is also suggested that the Rambler roses be well represented in this exhibit, also the teas, hybrid teas and noisettes, as well as the larger hybrid perpetuals.

Mr. Hill reported that he had attended the annual meeting of the American Association of Nurserymen at Detroit, and presented as best he could the claims of the American Rose Society to the nurserymen assembled. He said: "I was very cordially received and was given a good hearing. I do not know what the result may be, but hope some good may come from the effort. It occurs to me that no one thing will so direct attention to our society or will excite greater interest in its exhibition, than to give full prominence to seedling roses and special encouragement to the originators."

A letter was received from Mr. Schupp, secretary of the Chicago Florists' Club, stating that he was directed to say that his club desired to co-operate with the American Rose Society to the fullest extent, to make the coming exhibition a success.

J. J. Curran of Salem, Va., said: "I am heartily glad to hear that the Chicago Florists' Club is taking an interest in the society's welfare and know that if we can once get a good hold on the people out there, the success of the American Rose Society is certain."

"I would like to suggest that the Rose Society make an effort to disseminate among its members, in pamphlet form, accurate information concerning fertilizers, insecticides, fungicides and soil chemistry, which, in my estimation, would create much interest among the present members and have a tendency to attract the younger generation of growers. We want to give the members of our society something more in the bill of fare than a good time at conventions and shows; offer them the greatest help in the knowledge which they ought to have and which is not to be attained in the every day grind of greenhouse work. The co-operation of employers of labor in the rose growing business is absolutely necessary to the advancement of their help toward obtaining a scientific knowledge of proper conditions governing the management and controlling of greenhouse work."

Mr. May stated that this was along the line suggested at the annual meeting—that the Rose Society ought to have a quarterly publication.

The schedule of prizes for next year was gone over and it was decided to adopt the schedule used

at the Washington show. The list of special prizes has already been started with a considerable amount.

It was proposed to call a meeting of the Rose Society to be held during the S. A. F. convention at Philadelphia next month.

The committee voted to direct the secretary to prepare and publish a report of the society and to send the same to all the members.

Mr. Farenwald moved that the secretary be directed to express to the Chicago Florists' Club the thanks of the executive committee for their promise to co-operate and that east and west north and south do their best to make the show first class, next Spring; and in the meantime every effort should be made to secure as many annual and life members as possible.

Mr. Hill reported that he understood Alex. Montgomery, Alex. Scott, Peter Reinberg, Peter Bisset, Poehlmann Brothers, Myers & Samtman, F. Kramer and the E. G. Hill Company will all have new roses to exhibit, and stated that the appearance of so many new varieties will, if properly advertised, add interest enough to bring out a big attendance at Chicago.

President Simpson said that he would leave for Europe on the last of the month and would not be present at Philadelphia; that he expected, while away, to visit some of the best establishments in England, Scotland and Ireland, and hoped to bring back with him some matters which would be of interest to all rose growers. BENJAMIN HAMMOND,

Fishkill-on-Hudson, N. Y. Secretary.

OUR READERS' VIEWS

Peony Matters.

Editor Florists' Exchange:

I have read with much interest your recent reference to my remarks on the interpretation of the rules of nomenclature in connection with our peony studies. The point of order you make is undoubtedly well taken in the strict interpretation of rules of nomenclature, and I should agree with you in the main, did not I believe that rules are for our guidance, and to be exercised with judgment and common sense rather than with such strict adherence as will manifestly cause injustice to varieties or individuals. On this particular question my point was that, where two varieties of unequal merit, the one unquestionably valuable, the other mediocre or below, bear the same name, and where the records showed that the names were given at or about the same time; or in case the original descriptions were as vague and indefinite as many found in catalogues of to-day, obviously the sensible thing to do is to give the name to the best variety, and if it is necessary to rename the other one, do so. It does not seem to me desirable to perpetuate something distinctly unworthy just for the sake of absolute consistency.

If the two varieties are of equal merit, the case presents a different aspect. Then the variety which bears the earliest and best description should hold the name. Or in cases where the descriptions bear the same date, then the one which is clearest should, in my opinion, obtain.

The problem is an economic one, and must be handled with this point in view: worthless varieties should be eliminated. Then again, we can conceive of a case where a comparatively unknown variety of little worth bears the name of a well known variety of merit. The records may be clear showing that the poor variety should bear the name according to the law of priority. In cases of this kind it seems to me all the evidence should be gone over by the committee on nomenclature, and a decision made after carefully weighing the pros and cons of the case.

I observe that Mr. Betscher is disappointed in the matter and make-up of what he calls the much vaunted check list. He complains that it is not complete. Certainly no member of the committee on nomenclature made such a claim for it. If he had read the preface he would have seen at once that the committee stated that "This check list is the first step in the progress of this great work; that it is a mere beginning." I am of the opinion that this beginning is really worth something, and before anyone begins to "knock" he should take pains to read at least the first page.

Criticisms in the form of generalizations never advance any project. If Mr. Betscher has anything specific to offer in the way of correction or suggestion, the committee will be delighted to receive such observations. But a condemnation of the other fellow's work accompanied with a eulogy of one's own accomplishments never advances a cause very much. This note is not offered in a spirit of objection to criticism, but rather with a view of inviting such. Let us have it by

Annual Convention Numbers

OUR issues for the 17th, 24th and 31st of August will, all of them, be particularly desirable for advertisers who wish to make a special drive on their respective commodities.

The reasons why these three numbers will be especially worth while taking extra space in are:

The issue for August 17 will be replete with information regarding the coming convention of the S. A. F. O. H., and with interesting data, carefully compiled and pictorially presented, about Philadelphia, the city where the convention is to be held.

While many advertisers prefer the issue just preceding the convention and have proved conclusively that that particular number is always prolific of business to them, the two following issues—namely, those of August 24 and 31—will be equally effective in selling goods, as they will contain a full and complete report of the proceedings, together with various interesting illustrations to be gathered during the convention.

These three issues will be read and preserved for future reference by thousands in the trade, and your advertisement in either one or all of them will be sure to sell goods.

We shall take advertisements until 12 o'clock noon on Wednesday of each of the weeks named, but prefer to have "copy" earlier if possible.

If you sell anything that a florist needs, and desire to reach the entire trade of the country, here is your opportunity.

The Florists' Exchange

all means, but let it be directed against something definite and specific.

JOHN CRAIG.

Ithaca, N. Y. For Committee on Nomenclature of American Peony Society.

He Liked the Poem.

Editor Florists' Exchange:

I was pleased with the sentiment of the poem published in 'The Florists' Exchange' of July 20, but the construction of it was very imperfect, so I have made a revision of it, and had a number printed in our office. I enclose a few copies for your criticism. Also copies of very fine sentiment, "Do it Now," which we printed recently. Of course, you will admit there is some poetry in florists; they are not all prosaic. JOHN F. RUPP.

[The improvement made on the verses in question by Mr. Rupp is quite to our liking. The other document mentioned in his letter follows.—Ed. F. E.]

Do It Now.

Do not keep the alabaster boxes of your love and tenderness sealed up until your friends are dead. Fill their lives with sweetness. Speak approving, cheering words while their ears can hear them and while their hearts can be thrilled and made happier by them; the kind things you mean to say when they are gone, say before they go. The flowers you mean to send for their coffins, send to brighten and sweeten their homes before they leave them. If my friends have alabaster boxes laid away, full of fragrant perfumes of sympathy and affection, which they intend to break over my dead body. I would rather they would bring them out in my weary and troubled hours, and open them, that I may be refreshed and cheered by them while I need them. I would rather have a plain coffin without a flower, a funeral without eulogy, than a life without the sweetness of love and sympathy. Let us learn to anoint our friends beforehand for their burial. Post mortem kindness does not cheer the troubled spirit. Flowers on the coffin cast no fragrance backward over life's way. Die when I may, I want it said of me by those who know me best, that I always plucked a thistle and planted a flower where I thought a flower would grow. I expect to pass through this world but once. Any good thing that I can do or any kindness that I can show to any fellow creature, let me do it now. Let me not defer or neglect it for I shall not pass this way again.

Obituary

William Stone.

William Stone, superintendent of Pine Grove Cemetery, Lynn, Mass., died at his home in that city on Saturday, July 20, after an illness of several weeks. Mr. Stone was born in Lynn 68 years ago. After holding several city positions he was appointed cemetery superintendent twenty-one years ago, and during that period he succeeded, through his horticultural knowledge, in converting the grounds under his charge into one of the finest cemeteries in the East. Although not brought up a gardener, in his latter years he was an enthusiastic horticulturist and to his advice on horticultural subjects is due many of the fine floral dooryards which may be seen in his native city. He was of a genial and kindly disposition, always ready to help others. At the last annual meeting of the Houghton Horticultural Society of which he was one of the founders and an active supporter, the writer heard him express himself in these words: "While I have been with you I have tried to do my part and that I have to a certain extent succeeded all of you are aware. I do not expect to be with you many more years, but I shall leave you feeling satisfied that I have left marks that many of you will appreciate in years to come."

Mr. Stone was for several years president of the Houghton Horticultural Society, was an ex-president of the American Association of Cemetery Superintendents; took an active part in the New England Cemetery Association, was president of Master King's School-boys; of the Odd Fellows Insurance Association; had been chairman of the trustees of the State Lodge I. O. O. F., and a trustee of Abraham Lincoln Lodge K. of P.

J. W. D.

Ringling Detrimental to Tomatoes and Chrysanthemums.

The New York Agricultural Experiment Station at Geneva has been making experiments in the ringling of tomatoes and chrysanthemums, the results of which are given in Bulletin 288 of that station, from the popular edition of which prepared by F. H. Hall, we quote as under.

Ringling and Its Effects.

By cutting out a narrow ring of bark from the stem or branch of a fruit tree or grape vine, the grower sometimes adds to his profits. Early fruits and those of exceptional size often bring high prices; and ringling in some cases, aids in securing such products and even increases the total yield for the season. The operation may also make barren plants set fruit.

This process of ringling is effective because of a peculiarity in the sap circulation of exogenous (outside growing) plants, such as are all our fruit trees, vines and bushes, most of our vegetables and many of our cultivated flowers. In such plants the sap, with its supply of crude food materials absorbed by the roots, moves upward to the leaves largely through the outer portions of the old wood; while the descending currents, loaded with the starch and other foods elaborated in the leaves, pass through the inner bark and the growing new wood, or cambium layer, just beneath it. If a ring of bark and cambium be removed, the rise of the sap can continue almost as before; but the downward flow is checked and the food remains in the parts of the plant above the ring. This additional supply of food stimulates these parts so that they may become productive or bear earlier and larger fruits.

It must be remembered, however, that the parts of the plant below the ring will suffer through lack of food stored above. Ringling must, therefore, be used with caution; but it has been used with apparent advantage with grapes and apples in America and with these and many other fruits in Europe.

Ringling Herbaceous Plants.

These fruit plants are all woody; but the operation can be performed with equal or greater facility on herbaceous, or soft-stemmed plants. On theoretical considerations ringling would seem to promise good results with such soft-stemmed plants; for many of them are often grown in forcing houses in order to bring the product on the market out of the ordinary season. Yet very few records of the ringling of such plants have been found, either in American or foreign horticultural literature; but the few trials mentioned were promising.

Method Worth Testing.

It was accordingly decided to test the process on a commercial scale on tomatoes and on chrysanthemums, two plants whose product should show plainly any benefit from ringling. The method could be used with safety on these plants, since any deteriorating effect would be of little consequence, as the plants are discarded after the fruits or flowers are harvested.

Test on Tomatoes.

The test on tomatoes included about 140 plants of the variety Lorillard, grown in one of the station forcing houses during the Fall of 1905. These plants were selected from a much larger number and were very uniform at the start and were vigorous and productive throughout the test. They were trained to single stems.

One third of the plants were ringling when the blossoms of the second cluster had set, one-third after two other clusters had set, and one-third were left as checks. By means of a double-bladed knife a ring of bark and cambium five-eighths of an inch wide was removed from the stem of each treated plant at a point just below the first leaf that developed under the first fruit cluster.

Results with Tomatoes.

In no case was there any immediate ill effect from the operation; but the ringling plants soon began to show irregular, bumpy swellings on the parts above the rings; and, later, the foliage of these plants became more or less abnormal. The leaves curved downward, showed elevated, cushiony areas and developed very succulent tissue. Many of them also showed slight yellowing, indicating an unhealthy condition. Examination of ringling and unringling plants showed great retardation of roots, due to the ringling. This same effect was even more observable with the chrysanthemums tested the next year; for the roots on ringling plants were few in number, small in size and generally lacking in vigor. This poor development of the roots, indicating root starvation was greater, with both tomatoes and chrysanthemums, as the ringling was earlier.

These features show a severe disturbance of plant physiology, and indicate how serious a check upon growth ringling may be.

There were no compensating advantages in the yield of tomatoes; for the average number of fruits was decreased 18 per cent. by the first ringling and 10 per cent. by the second; and the corresponding losses in weight per plant were 16 per cent. and 12 per cent. respectively. The individual fruits from the plants first ringling averaged about one-sixteenth of an ounce heavier than those from plants not ringling. Fruits from plants ringling later weighed about one-twentieth of an ounce less than those from the checks.

There was no gain in earliness of fruits in favor of ringling, neither was there any difference in flavor or color.

Tests with Chrysanthemums.

In the season of 1906 chrysanthemum cuttings of five different varieties were secured and one hundred good, uniform plants of each variety were selected for a test of the effect of ringling on flower production.

Each plant was trained to a single stem and only the terminal bud was allowed to develop. The ringling of one-third of the plants of each variety was done when the buds had just appeared, and of the second group twenty days later, while the remaining plants served as checks.

The injury to the foliage of the ringling plants was more pronounced than in the case of the tomatoes, in some cases amounting to practical loss of all the leaves. Similar enlargement of the stems above the rings appeared, and on one variety, marked abnormal protuberances. With the chrysanthemums, though not with the tomatoes, the ringling plants were somewhat dwarfed.

The flowers were decreased in size by the ringling, one-half an inch in diameter by the first ringling and more than one-tenth of an inch by the second. The early ringling also hindered the opening of the buds of all but one variety; but the second ringling hastened the maturity of the flowers of four of the five varieties, though only to a slight extent.

As noted under the test with tomatoes, the roots were much retarded by ringling; and few or no suckers formed on the roots of the plants first ringling.

Conclusions.

From these tests it appears very doubtful whether ringling can ever be beneficial to herbaceous plants, since the visible loss in vigor is great and there are no compensating gains.

The tests also raise the question whether the deteriorating effect of ringling on woody plants has received sufficient attention. These plants must suffer in the same way as do herbaceous species from the decreased vigor of parts below the rings, though perhaps not to the same extent. The more apparent gains in early and larger fruit have received the greater notice, but it is possible that careful study would show deterioration great enough to overbalance these gains.

Sweet Peas and the Mendelian Law.

Before the Scientific Committee, R. H. Biffen showed a very interesting series of sweet peas to illustrate the discoveries so far made in regard to the laws of inheritance as exhibited in these plants. The great majority of crosses and so on had been made by Mrs. Biffen. The following were included in the series.

(1.) Cream crossed with white gave all white (i. e., white dominant over cream). In the second generation from these white self fertilized, white and cream plants were produced in the proportion of three white to one cream. The cream breeds true in the following generation, but only one in three of the whites is pure, the remaining two again producing creams.

(2.) White crossed with white in the first generation gave a sweet pea approaching Painted Lady in type. The seeds of this, by self fertilization, gave Painted Lady and white in the proportion of nine of the former to seven of the latter, showing that one white parent carries a certain factor, the other, another, which meeting produce the red color. In the third generation the whites breed true and one of the reds.

(3.) White $\times$ Blue in the first generation gave purple, and in the following purple, blue, white, and Painted Lady. The parents thus carry the two red producing factors whose existence is demonstrated in the cross between the two white peas mentioned above. Where these meet in the presence of the blue color, purple is formed, in its absence Painted Lady. Seeds of the purple plants may reproduce the whole color series again, those of the Painted Lady, white and Painted Lady only. The white colors breed true, but blue may throw white.

(4.) Cream with purple picotee edge $\times$ Mont Blanc (white) gave purple and in the second generation cream, white, cream with picotee edge, white with blue edge, Painted Lady and purple. The character producing the picotee is dominant over the non-picotee. The parents carry the factors for red demonstrated in the case of the cross between the two white varieties, which on meeting give Painted Lady. In addition to these characters there are yellow and white, the former being recessive to the latter. Non-picotees breed true to this character. Picotees breed true in the proportion of one to three. Thus a picotee white may throw picotee white, picotee cream plain white and plain cream, but a plain cream will breed true from the outset.

(5.) Eric Hinton (Pink, with waved standard) $\times$ Hon. F. Bouverie (pink, with buff tinge due to the presence of yellow chromoplasts, standard not waved). In the first cross the color of the flowers was deep rose,

similar to Prince of Wales, and all had flat standards, in the second the flowers were yellow, pink, and buff with flat standards and yellow and pink with waved standards. Waved forms had not so far occurred in buff colors.

(6.) Bouverie (pink and cream) × Navy Blue gave in the first generation purple. In the following generation segregation into purple, pink, pink with cream, cream and tinged white occurred, and each of these types may or may not be flaked.

(7.) If this be compared with the results obtained by crossing another pink with Navy Blue, the same colors are produced, but no flaking occurs owing to the absence of the determining factor in one of the parents.

The series demonstrated the possibility of predicting the colors of the offspring in the second generation of any particular cross with great certainty, and showed the facility with which any particular two characters may be combined in any plant. In answer to questions, Mr. Biffen said that it was impossible to say beforehand in the case of two whites whether or not they carried the color-producing factors. This could only be determined by experimental crossing. Several members remarked upon the desirability of trying the effect of crossing the wild sweet pea of Sicily with some of those known at present. A hearty vote of thanks was accorded to Mr. Biffen for his exhibit and explanatory remarks. —Journal of Horticulture, Eng.

FOR THE RETAILER

Seasonable Decorations.

The florists at the social colonies are reaching their busiest period, the months of August and September. The outlook was viewed somewhat pessimistically early in the season, but business has picked up wonderfully in the last few weeks and the usual rush is looked for. Garden flowers are not over plentiful, and the city wholesalers have been called upon to fill the deficiency. Large quantities of gladiolus and other flowers are being shipped every week. Gladiolus America proves a great favorite, owing doubtless to its delicate coloring, and large segments. These flowers were recently used at a luncheon for forty with splendid effect. English garden baskets were employed on this occasion. These baskets are about thirty inches in length and fifteen inches wide, with a low handle across the center. The baskets were so arranged with the gladiolus as to give the impression of the blooms having been picked in the garden and placed on the table without other preparation. Clusters of Adiantum cuneatum were placed where the handle crossed. Bows of soft pink ribbon, with long streamers, were tied on the handle and allowed to radiate over the bare portions of the table, this being relieved with sprays of Adiantum gracillimum and single blooms of Liliun speciosum rubrum.

Another pretty luncheon decoration was done with delphiniums in various shades of blue. Tall silver vases were filled with these, the different colors being arranged in clusters, several shades in the same vase. Long sprays of Asparagus tenuissimus fell in graceful festoons from among the flowers, and were arranged in formal design on the table.

A Japanese effect was the subject for a large dinner decoration where the guests numbered one hundred and fifty. The piazza, under which the affair was given, was entirely enclosed with branches of pin oak, even the ceiling being covered. Numbers of Japanese lanterns were suspended from this; these filled with electric lights shed a soft glow over the diners. The tables were of various sizes, from small round ones for eight to that of the hostess at which twenty persons were seated. Each round table had a large Japanese umbrella fastened into the center of plateaus filled with flowers, each table being differently treated. Diminutive lanterns were suspended from the ribs of the umbrella, lighting up the table. Lights were also placed among the flowers of the center pieces, being partly hidden. In the center of the large table was placed an aquarium three feet long and two feet wide, arranged to represent a marine landscape. Large pieces of coral rested on the sand at the bottom, hiding electric lights. Several varieties of Japanese goldfish, and some beautiful shells, with water lilies floating on the surface, formed a delightful cen-

ter-piece. Two smaller aquaria fitted up in a similar manner were at either end of the table. Bamboo posts were placed at each corner of this table, supporting a lattice work of the same material, the canes being two feet apart; these were lightly entwined with sprays of Asparagus Sprengeri. Flowers of Nymphaea devoniensis were placed at irregular intervals throughout this lattice work, their immense, superbly colored blooms making a magnificent show with the small rose colored electric lights which were dotted through the arrangement. Groups of white and pink hollyhocks were stood in the available corners of the piazza, the stalks being cut full length and placed in vases of water, hidden by branches of oak. Corsages of cattleyas and buttonholes of gardenias were worn by the guests, giving a finishing touch to one of the most gorgeous affairs of the season.

Some very fine specimens of Acalypha Sanderi, with large plants of Adiantum cuneatum, formed a handsome window decoration this week, showing the value of this curious plant for Summer work. The plants were in 8-inch pots, and were well furnished with racemes of flowers, some measuring eighteen inches. They were the object of many inquiries, illustrating the value of novelties as window attractions. D. RAYBUN.

NEW ENGLAND DAHLIA SOCIETY.—The executive committee of this society met in session on July 11, and after free deliberation, it was voted that the previous vote to co-operate with the Massachusetts Horticultural Society in giving an exhibition of dahlias on September 4 and 5 be rescinded; that the contributors to the prize fund be thanked and notified that on more extended and

Bride's Bouquet

Artist, William Berger, Germantown, Pa.

Photo by Fred. Berger.

mature consideration by the executive committee, it has been deemed wise to defer all exhibition work for the present season and that the treasurer be instructed to refund the contributions.

The work of creating a proper and perfect classification and a set of rules for judging which must be established before we can give an exhibition, is of the greatest importance and requires careful deliberation, much more so than at first anticipated, and this reason alone was ample justification for the action of the executive committee.

Every member of the society is urged to assist in the exhibit of the nearest horticultural society, and in that way give special prominence to the dahlia.

Those who have a possible chance to exhibit on September 5 and 6 at Boston should try their utmost to make this exhibit eclipse all previous ones.

Bride's Bouquet.

Our illustration shows a bridal bouquet, made by William Berger, Germantown, Pa. The bouquet was composed of Bride roses with fronds of Nephrolepis Ameripoli and Adiantum hybridum supplied by William P. Craig, Philadelphia.

\$10,000 FOR ROSES FOR MUNICIPALITY.—Fifty thousand francs (\$10,000) are spent annually by Paris municipality on roses wherewith to deck the offices of the municipal authorities. M. Felix Roussel, president of the Council General, made this discovery on asking a florist's employee who refilled the vases. The gardens were unable to supply a sufficient quantity. Roses at ten francs (\$2) a dozen were bought, 3,000 francs (\$600) being spent for M. Roussel alone.

DIRECTORY OF RELIABLE RETAIL HOUSES

The retail florist firms advertising under this heading will accept and fill orders for flowers and floral designs forwarded them by mail, telegraph or telephone, the usual commission of 25 per cent. being allowed.

\$25.00, payable quarterly in advance, will entitle the advertiser to a four-line card, under this heading, for one year, 52 insertions. For every line additional to four, \$5.00 will be charged. Four lines will average 32 words; each additional line, 9 words. Each advertiser receives one copy, free, of our Florists' Telegraph Code.

New York.

YOUNG & NUGENT, 42 West 28th St. We are in the theatre district and also have exceptional facilities for delivering flowers on outgoing steamers. Wire us your orders; they will receive prompt and careful attention.

Retailers desiring a share of out of town trade should be represented by a card in this column.

CLUB AND SOCIETY DOINGS.

NEWPORT (R. I.) HORTICULTURAL SOCIETY.

A meeting of the Newport Horticultural Society was held Tuesday evening, President Butterton in the chair. There was a fair attendance of members to hear the report of the secretary on the recent show and the recommendations of the executive committee in relation to the show to be held in September. The schedule of premiums as arranged and recommended by the committee was adopted with a few minor changes. This show, it is expected, will be larger than any yet held since dahlias have been prominent features. In addition to as many classes for dahlias, in which both private and commercial men can compete as usual, there will this year be a commercial class exclusively, and that for the largest collection. This provision is made in the interests of both classes of growers; first, it is in the interest of private gardeners because it is known that as far as members of varieties are concerned, they are unable, as a rule, to make much of a show in competition with large commercial growers; and again, commercial growers will find it much more interesting to

the project, and the Park Commissioners gave the use of the fine new building free with the exception of the cost of illumination. Notwithstanding all this, the exhibition cannot be described the success we would have wished. Long Branch has a permanent resident population of some thirteen thousand, and the Summer influx reaches nearly as many more, but somehow the predominant race is not such as support horticulture, especially from an exhibition point of view. Round about about here though, are being wrought into shape many very beautiful country places, and wherever a group of gardeners gather, a society and the inevitable exhibition follows. In this Elberon society we have perhaps the youngest of the American horticultural societies, and their endeavors are not only to be commended but deserve the helping hands of others and older ones. We were told that there were some 80 members in this society, and regret to state that the exhibitors numbered merely a dozen or so. These few hard workers did bravely and deserve much credit. It is to be hoped that in some way their next Summer show will be nearer the grounds of the Monmouth County Horse Show Association, where better financial results are sure to follow. The premiums were mostly won by local gardeners.

Arrival at the Falls

Where's That Chicken? At Dickey's

(See Washington Letter, Page 152)

Photos. by Peter Bisset

compete in one class at least with men of their own standing only. In all the other classes, except one or two for amateurs, there are no restrictions; all may enter and compete together.

The society's medal will be awarded for the best seedling cactus dahlia not in commerce at the time exhibited. There will also be a generous cash prize for a collection of seedling dahlias. It is expected that commercial growers will be largely represented at this show. There will be one exhibit from a Boston firm that will fill 300 bottles.

Besides the provision made in the schedule for this show for dahlias, it provides liberally for all other kinds of cut flowers as well as plants, fruit and vegetables. There are also premiums offered by Summer residents for original table decorations and miniature flower gardens. Henry A. Dreer offers a silver cup for vegetables. Altogether it cannot fail to be a most interesting exhibition generally.

D. M.

ELBERON (N. J.) HORTICULTURAL SOCIETY.

The second annual exhibition of the Elberon Horticultural Society was a two-day event, and was held in the New Casino, Long Branch, N. J., July 24 and 25. The Mayor and officials of the borough formally opened the show and spoke in eulogistic terms of the society and its aims. The local papers devoted much space to

The roses exhibited were few in number and of poor quality. A culture certificate was awarded to Henry A. Dreer, Inc., of Philadelphia, for a display of aquatics. Lager & Hurrell, Summit, N. J., received honorable mention for a display of orchids, and Herbert Hall, florist, Long Branch, N. J., a similar award for his exhibit.

The judges were Alexander McKenzie and W. H. Waite. Herbert Hall and R. R. Hughes were in charge of the show. Among those in the trade present were William Scollay, of John A. Scollay, Brooklyn, N. Y.; W. A. Marshall, seedsman, New York; W. A. Sperling and George Struck.

J. I. DONLAN.

TARRYTOWN (N. Y.) HORTICULTURAL SOCIETY.—The regular monthly meeting of this society was held in Good Templars' Hall, on July 26, President Howard Nichols in the chair. Robert Angus ably opened a discussion on judging of vegetables, which was afterward well threshed out by the members. It was generally conceded that too much merit was placed on size at the expense of table quality. A prize is to be offered at the August meeting for the best six varieties of vegetables.

The annual outing of the society takes place at Rye Beach on August 6, when it is expected the boys will all be feasted with fish.

D. M.

Society of American Florists and Ornamental Horticulturists

Incorporated by Act of Congress March 4, 1901.

Preliminary Programme of the Twenty-Third Annual Meeting and Exhibition to be held at Philadelphia, Pa. : : :

August 20, 21, 22, 23 and 24, 1907

The sessions of the convention will be held in the Broad street Theater, opposite Horticultural Hall.

Opening Session, Tuesday, August 20, 1907, 2 P. M.

The members will be welcomed on behalf of the State by Hon. Edwin S. Stuart, Governor, and on behalf of the city by Hon. John E. Reyburn, Mayor. W. W. Castle, of Boston, Mass., will respond to the welcoming addresses. The annual address of the President of the Society, and the reports of the Secretary, Treasurer, State Vice-Presidents, Committees, and other officials will be presented.

Judging Exhibits.

Immediately after the close of the opening session the judges of the exhibits will examine same and prepare their reports upon the novelties and new inventions in the trade exhibition.

President's Reception, 8 P. M.

The President of the Society will receive the members at 8 p. m. in the Broad street Theater under the auspices of the Philadelphia Florists' Club. Music and refreshments.

Second Day, Wednesday, August 21, 9:30 A. M.

Judges of Exhibits will present reports. Addresses will be presented on the following subjects:

Hardy Shrubs—How to Plant and Treat Them—S. C. Moon.

The Effective Arrangement of Hardy Perennial Plants—Ernest Hemming.

Hardy Bulbous and Tuberous Rooted Perennials—E. V. Hallock.

Bedding Plants—Where and How to Use Them—A. Frey.

Selection of Next Meeting Place and Nomination of Officers.

The selection of the location of the next meeting (polls open one hour), nomination of officers and roll-call of States for nominations for State Vice-Presidents for next year will take place at this session.

Ladies' Auxiliary.

The Ladies' Auxiliary will convene in session.

Trip Up the Delaware.

On invitation of H. A. Dreer, Incorporated, the society will board the excursion boat leaving Arch street wharf at 1 p. m. sharp, for a trip up the Delaware River to Riverton, N. J.

Shooting Tournament.

The team and individual shooting contest will take place at the Florists' Gun Club grounds, Wissinoming. For entries and information, address A. B. Cartledge, 1514 Chestnut street, Philadelphia, Pa.

Wednesday, 8 P. M., Illustrated Lecture.

An illustrated lecture will be given by J. Otto Thilow in the Broad street Theater, the subject being "The Flora of Yellowstone Park and Puget Sound."

Discussion of Recommendations in President's Address. Reports of Special Committees.

Third Day, Thursday, August 22, 9:30 A. M.

Subjects for discussion at the morning session will be

Horticultural Education.

Horticultural Education in the Common Schools—E. V. Hallock.

Horticultural Education in Agricultural Schools—Theo. Wirth.

Horticultural Education by Horticultural Societies and Clubs, including a review of the work of the Boston Landscape Class—John K. M. L. Farquhar.

Discussion on Above Subjects.

Election of Officers, 10 A. M.

During the discussion on the above subjects as presented covering horticultural education, the election of officers for 1908 will take place, the polls being kept open one hour, and until all legal voters in line at that time shall have an opportunity to cast their votes.

Question Box.

The Question Box will be opened and general discussion had upon the subjects therein referred to.

Society of American Florists

YOU ARE INVITED to visit us during Convention week, any day at your convenience.

ANDORRA presents a unique Nursery—six hundred acres of hilly land, containing over three hundred and fifty acres of **Ornamental Trees, Shrubs, Vines and Perennials.** Our **Location** permits us to grow many varieties both in deciduous and evergreen trees and shrubs that cannot be grown to advantage North or South of this latitude, and thus adds to our extensive collection many desirable and decorative plants.

ANDORRA has been called **The Modern Landscape Nursery.** The lay-out of our land, with its hills, valleys and woodland, permits the planting of trees and shrubs in natural positions, thus affording planting suggestions at every turn.

ANDORRA is easily and quickly reached from the Convention (Horticultural) Hall by the Pennsylvania Railroad from Broad St. Station (at Broad and Market Sts.) to Chestnut Hill Station; then by trolley, which passes the depot, to the City Line. Our office is one block from the trolley terminus at City Line.

REMEMBER, this is a personal invitation to **YOU.**

A Few Penna. R. R. Trains.

Proprietor of ANDORRA NURSERIES,

Bell Telephone, Chestnut Hill 225.

CHESTNUT HILL, PA.

Bowling Tournament.

The bowling contest for teams representing the various Florists' Clubs will take place at 1:30 p. m. The Ladies' Bowling Contest will take place at 2 p. m. Location of alleys will be announced later. For further information inquire of Wm. Graham, Chairman Committee on Bowling, 104 South Thirteenth street, Philadelphia, Pa. Handsome trophies will be provided.

Annual Meeting Florists' Hall Association.

Broad street Theater, 3:30 p. m.

Thursday Evening Session

Open 7:30 p. m.

The National Flower Show.

Discussion will be had regarding the National Flower Show to be held in 1908.

Unfinished Business.

Two-minute Talks by members on general subjects of advantage to the Society.

American Carnation Society.

Immediately after the adjournment of the evening session a meeting of members of the American Carnation Society will be held.

Friday, August 23.

The program as arranged for the fourth day, Friday, is as follows: 10 a. m.—The society will be the guest of the Philadelphia Florists' Club, at Belmont Mansion, Fairmount Park. The visiting ladies will be taken to Willow Grove and there entertained. Special announcements covering entertainment will later be made by the Philadelphia Florists' Club.

Saturday, August 24, 10 A. M.

Meeting of Executive Board.

The Trade Exhibition.

The trade exhibition will be located in Horticultural Hall, corner Broad and Locust streets. Growers of plants, seeds, bulbs, shrubs, and trees, dealers in florists' supplies, greenhouse requisites, building material for greenhouse construction, heating apparatus, etc., can here meet the best buyers in the horticultural profession.

N. B. Exhibitors are reminded that the duties of the judges are limited to the consideration of exhibits and to the making of awards to novelties and improved devices only. Exhibitors are required to make previous entry of all such exhibits with the superintendent in writing. Full rules and regulations, together with diagrams of the exhibition hall, may be obtained from David Rust, Horticultural Hall, Broad and Locust streets, Philadelphia, Pa. Superintendent, to whom all applications for space should be made as early as possible.

Chairmen of Convention Committees.

The S. A. F. O. H. Membership.

Editor Florists' Exchange:

Apparently the Society of American Florists and Ornamental Horticulturists is not increasing in membership with such rapidity as many of its members would wish, and it seems also that many who are engaged in commercial horticulture are not on the list of its members. That the latter class in considerable numbers should see fit to hold aloof from a society that aims at nothing more than the betterment of commercial horticultural conditions is unexplainable, but that large numbers of another class of horticulturists should hesitate in affiliating is not so hard to understand under the impressions now prevailing as they have prevailed for years. It is generally understood in the circle embracing private gardeners that they are not wanted in the Society of American Florists for much the same reasons as are sometimes set forth for keeping trade literature out of the hands of private gardeners and others. Although the social and educational sides of the S. A. F. O. H. are never lost sight of, still it must be admitted that the society is held together by the common understanding of its members that its main objects are the development of commercial horticulture and kindred interests, and the advancement of that section of its membership engaged therein. Now the question is, whether or not the admission into membership of private gardeners in large numbers would alter the society eventually in such a way that those objects would cease to be the main ones. There are many who believe that it would not, that it would simply strengthen the society throughout the country and make it what many think it was intended to be and should be a national horticultural society.

Should a movement be made now or at any time to bring private gardeners into membership in the S. A. F. O. H., there does not seem much necessity for a change in the name unless it would be to leave out the word "ornamental" before "horticulturists," which appears superfluous if not meaningless. There are several ways by which the interests of private gardeners could be represented in the national society. One way, and perhaps the one by which the membership would be more largely increased than by any other, would be to admit as members of the national society ten per cent. of the members of every horticultural and florists' club and society in the country, such members to be known in the local societies as delegates from them to the national organization, the election of these delegates to take place at the annual meeting of each club or society, and the dues decided upon for such membership by the national society to be paid by the local organizations and not by the individuals forming the delegations. There is more than one reason apparent to me why such a scheme would appeal strongly to local societies, but the one that I think would appeal to them most is that the knowledge of their being the choice of their organizations for representation at the meetings of the national society would cause them to think highly of their mission, that is, so far as those who would be

elected would be concerned. Then again, this manner of representation would tend to greatly increase the interest in the national society in every locality in proportion to the numerical strength of the local organizations—not as now, when very little is heard about it in parts where commercial growers, members of the S. A. F. are few in numbers.

Another reason why such a scheme for representation would become popular is, that a number, each of whom would be known to the other, going in a body, would make the trips more pleasant than if each one would go independent of the other in the event of them being members on their own account; if they would go at all, which in many cases would be extremely doubtful.

A powerful national horticultural society would be almost without limit in the aid it could give to horticultural advancement, and there appear to many no reasons why any one section of horticulture should in the least suffer by the society embracing to the fullest extent all kindred interests, and especially that class which, in the main, is composed of men of the highest intelligence and foremost in knowledge of certain branches of horticulture.

This question of keeping prices and other matters supposedly sacred to commercial men from the knowledge of private gardeners is nothing more or less than rubbish. Nearly every gardener knows perfectly well that wholesale growers sell their goods to those in the trade at a much lower figure than they purchase the same goods for from the retail dealers, and they recognize the perfect right of the retailers to charge a price which allows a fair profit. As to the contention that private gardeners attempt the purchase of goods at wholesale, it has very little foundation in fact, perhaps not so much as the contention on the other side that wholesalers offer goods to private gardeners at wholesale prices if retailers in the neighborhood do not purchase in satisfactory quantities.

B.

PERMANENT LABELS.—M. Crawford writes to the Rural New Yorker endorsing carbolineum as a preservative for plant labels. He says: "A few years ago my attention was called to carbolineum. I obtained a quart for 30c., and I found it to be all that was claimed for it. When a label was wanted it was stuck into the liquid an inch or two, and the surplus preservative was spread with the finger. If two were needed one was dipped and then rubbed against a dry one, till both were covered. Later on I procured a small, flat brush, that stands in the jar under the cover, and with it I can take up what is needed and apply it without soiling the fingers. In planting time we keep treated ones on hand. If written upon with a lead pencil before they are dry—and this requires some days—the writing becomes indelible, and will remain so for at least five years, even if buried in the ground. I have yet to see the first signs of decay in a label treated with carbolineum, and as long as the label stands the writing is there. Every nurseryman knows that a lead pencil will not 'bite' on a smooth, unpainted label, but this is not so with one treated with carbolineum. It makes a blue-black mark that is pleasant to see and is there to stay. There is more in this for horticulturists than appears at first sight."

New York.

The Week's News.

Seldom have we seen so much prior interest manifested in this city in an S. A. F. convention as this year. Nearly every wholesale man who possibly can intends to be present. President Stewart is very popular with the commission men here; and his many friends will attend the gathering out of courtesy to him. The nearness of the convention city is also a factor influencing the attendance from New York and vicinity, as well as the anticipated trip to the Dreer establishment at Riverton, N. J., which in itself will be a drawing card. The fame of this great plant factory is worldwide but there are many who have never had ocular demonstration of its magnitude, and by all such the Riverton trip is eagerly looked forward to.

The club's transportation committee, consisting of Messrs. Nugent, Traendly and Young, have all but concluded arrangements. The delegation from this city will leave by the Pennsylvania Railroad at 9:55 o'clock on Tuesday morning, August 20, arriving in Philadelphia in time to have dinner before the opening session at 2 p. m. A circular will be distributed by the committee shortly giving full particulars as to trains, rates, and other material matters.

We heard numerous inquiries this week as to where the society will go next year. So far there has been no open announcement of any candidates being in the field for this honor.

On previous occasions, about this time of year, we have commented on the faithfulness of the wholesale dealers to duty during the heated term. This year as usual sees the majority of them at their posts daily. In this respect such veterans in the business as John I. Raynor, Walter F. Sheridan, E. C. Horan, J. K. Allen, John Young, Frank H. Traendly, Wm. H. Gunther and others set an example to their younger confreres. Numbers of the help in the wholesale houses are now enjoying the invigorating breezes of mountain and sea; and some of the principals contemplate taking a brief breathing spell in the near future.

William S. Allen will join his family next week on an island off the Maine coast. Joseph S. Fenrich and family are taking their vacation at Ocean Grove. John Seligman, accompanied by his wife and family, is rusticating in the Catskills; on Mr. Seligman's return to business, his partner, Mr. Levy, will leave for a week's outing on the Maine coast.

Horace E. Froment was busy this week superintending the construction of a barrier near the rear end of his store, in the form of a counter running the whole width of the room. The enclosure thus formed will be utilized for the grading and handling of choice stock, preventing interference with it by outsiders. Mr. Froment intends taking in the Philadelphia convention, the date of which comes during his annual vacation. It will be the first S. A. F. gathering he has attended, and he is anticipating a pleasant as well as a profitable time.

A. H. Langjahr, speaking of the plethora of gladiolus now in the market, says the number of growers of this flower has been greatly augmented this year. There is not much money in gladiolus, however, when the blooms reach the city in the height of the plants' flowering season; early sorts pay best.

James McManus, the orchid cut flower specialist, says it is now possible to have a supply of orchid blooms all the year round. The demand at present is not particularly active.

Frank S. Hicks & Company are gratified at the business that has come their way since establishing themselves in Twenty-eighth street. The whirl of the city's wholesale center seems particularly agreeable to Mr. Hicks who finds it quite an acceptable change from Brooklyn, his former location. Mr. Van Ruyper, formerly a grower in New Jersey, is with Mr. Hicks.

A. M. Henshaw is now well established in his new store over that of Traendly & Schenck. It is nicely fitted up, and Mr. Henshaw has ample facilities for his fast increasing trade.

David Falconer, rose grower, Chatham, N. J., was in town this week. Mr. Falconer consigns his flowers to J. K. Allen.

WHEN you attend the Convention of the S. A. F. COME TO WYNCOTE and SEE OUR KENTIAS.
25 minutes' ride on Reading Railway; 100 trains every day.

JOSEPH HEACOCK COMPANY
WYNCOTE, PA.

Leonard Barron, secretary of the Horticultural Society of New York, contributed a lengthy article to last Sunday's Herald, urging more extensive plantings of perennials by amateur gardeners.

Word comes from Detroit, Mich., that C. W. Ward of Queens, N. Y., is under doctor's care there, suffering from a mild attack of nervous prostration, superinduced by his having been overcome with the heat, previous to leaving New York for the West. After he has sufficiently recovered Mr. Ward intends going to the New Hampshire mountains for two or three weeks to recuperate. In the meantime all work is forbidden him.

Small & Sons still maintain their aquatic window display—attractive and refreshingly, cool-looking these sweltering days. Wm. K. Trumppore, buyer for this house, left Tuesday, with his family, for the Adirondacks where he will spend his vacation. Frank D. Hunter of the same firm will take his annual respite from business about a fortnight hence.

S. S. Butterfield of The Florists' Exchange staff left last week for Jamestown, N. Y., to attend the funeral of his father, who died on Friday morning, July 26. Mr. Butterfield was a native of England, but had resided in Jamestown, where the other members of his family are located, for many years. He was 81 years of age, and had been ailing for some time.

Hitchings & Company have secured the contract for the erection of a greenhouse at Summit, N. J., for N. N. Coler, Jr.

W. F. Ross of the F. R. Pierson Company, Tarrytown, N. Y., returned from a visit to Scotland, on Saturday last on the S.S. Columbia.

Frank McMahon, the well-known rose grower at Seabright, N. J., was on July 17, elected the first mayor of the new borough of Rumson, N. J. Mayor McMahon is forty-six years old and was born at Fair Haven, N. J. He attended school in the Shrewsbury township public schools. Early in life he turned his attention toward the florist business, although for a couple of years he was a bank clerk in New York, relinquishing the latter because of ill health and coming to the country. In 1885 he resumed his horticultural business, purchasing his present establishment at sheriff's sale. Mayor McMahon is one

of the largest producers of roses for New York and is one of the leading spirits and a director in the New York Cut Flower Company. He is a member of the Masons, Knights of Pythias and Royal Arcanum.

Wm. Elliott & Sons received one hundred cases of French bulbs for the steamer Roma last week. The stock arrived in prime condition.

Wheeling, W. Va.

This is an exceptionally good town for the florist trade. The business is well represented by both the store men and the growers. The Pittsburg market, however, is daily called on for the largest portion of cut flowers used in the different stores.

John Dieckman, who has probably more glass than any other grower in Wheeling, has recently purchased a piece of property some distance out from the city where he will erect an entirely new range of houses. His present houses are on leased ground and very undesirable on account of the smoke and soot from nearby manufacturing establishments.

L. A. Smith and W. F. Zane & Son are located on the island a considerable portion of the city of Wheeling being situated on an island in the Ohio river. The underpinning of these greenhouses stands fully six feet above ground level as a precaution in the case of high water when the Ohio sometimes gets on a rampage. Last Spring, Mr. Smith informs me, the water was over the tops of all his shrubbery and he had to get from his residence to the greenhouses daily in boats.

Mr. Zane tells of the trouble he had in saving a fine piano by carrying it upstairs.

The Wheeling Greenhouse Company conducts a store in front of the post-office, in a building rented from the Odd Fellows. This company is now without greenhouses. Those formerly owned by the company were purchased by Mr. Dieckman who until that time was one of the partners of this concern. Miss Forbes, who at one time conducted the retail end of the business and had charge of the store and was also a partner in the company, is now conducting a business for herself under the McClure hotel. Miss Forbes has taken a partner into the business with her; the style of this firm is The Misses Forbes and Donahay. These ladies are

very popular with the flower buyers of Wheeling and get a large portion of the trade in their city.

Mr. Langhan has a good stand on Market street; he is not a grower and gets his supplies daily from the Pittsburg Cut Flower Company. J. M.

Dreer's Convention Month Specials

Cocos Weddeliana

A grand lot of plants in 5 inch pots, elegant graceful specimens, about 24 inches high perfect in every way, something entirely different from what you have been offering to your customers in the decorative line heretofore and a plant which will appeal to everyone, price \$1.00 each, singly or by the hundred. We are also carrying in stock an elegant line of the usual sizes for Fern Dishes in good shape.

2 1/4 inch pots, 5 to 6 inches high, \$1.50 per dozen; \$10.00 per 100; \$90.00 per 1000.
3 inch pots, 8 to 10 inches high, \$2.00 per dozen; \$15.00 per 100; \$140.00 per 1000.

KENTIAS

Although the stock of Kentias generally is scarce not only in this country but also in the Palm centers of Europe, you will find our stock of nearly all sizes very complete, and while some of the medium sizes are not quite as heavy as we have supplied in some seasons past, you will find all of the stock here offered of excellent quality and value.

WE OFFER IN

Kentia Belmoreana

2 1/4 in. pots, 4 leaves, 8 to 10 in. high; per doz., \$1.50; per 100, \$10.00; per 1000, \$90.00.
3 in. pots, 5 leaves, 12 in. high; per doz., \$2.00; per 100, \$15.00; per 1000, \$140.00.
4 in. pots, 5 to 6 leaves, 15 in. high; per doz., \$4.50; per 100, \$35.00.
6 in. pots, 6 leaves, 20 to 24 in. high; \$1.00 each.
6 in. pots, 6 to 7 leaves, 26 to 28 in. high; \$1.50 each.
9 in. tubs, 7 to 8 leaves, 5 ft. high, very stocky; \$10.00 each.
11 in. tubs, 7 to 8 leaves, 6 ft. high, very stocky; \$20.00 each.
11 in. tubs, 8 to 9 leaves 7 to 8 ft. high, very stocky; \$25.00 each.

We especially call your attention to the three sizes offered at \$10.00, \$20.00 and \$25.00 each; these are handsome specimens, such as you have rarely had an opportunity to buy.

Kentia Forsteriana

3 in. pots, 5 leaves, 12 to 15 in. high, \$2.50 per doz., \$20.00 per 100.
4 in. pots, 5 to 6 leaves, 15 in. high, \$5.00 per doz., \$40.00 per 100.
6 in. pots, 6 leaves, 24 to 28 in. high, \$1.00 each.
6 in. pots, 6 leaves, 30 to 32 in. high, \$1.50 each.
7 in. pots, 6 leaves, 36 to 40 in. high, \$2.50 each.
7 in. tubs, 6 leaves, 48 in. high, \$4.00 each.
8 in. tubs, 6 leaves, 54 in. high, \$5.00 each.
8 in. tubs, 6 leaves, 54 to 60 in. high, \$6.00 each.
9 in. tubs, 6 leaves, 40 to 42 in. high, \$3.00 each.
9 in. tubs, 6 to 7 leaves, 5 1/2 feet high, \$8.00 each.
10 in. tubs, 6 to 7 leaves, 6 feet high, very heavy specimens, \$12.50 each.
10 in. tubs, 6 to 7 leaves, 7 to 8 feet high, tall decorative plants, \$12.50 each.
12 in. tubs, 6 to 7 leaves, 8 to 9 feet high, tall decorative plants, \$17.50 each.

Kentia Forsteriana—Made-up Plants.

7 in. tubs, 4 plants in a tub, 34 to 36 in. high, \$2.50 each.
7 in. tubs, 4 plants in a tub, 36 to 38 in. high, \$3.00 each.
8 in. tubs, 4 plants in a tub, 40 to 42 in. high, \$4.00 each.
8 in. tubs, 4 plants in a tub, 42 to 48 in. high, \$5.00 each.
8 in. tubs, 3 plants in a tub, 4 1/2 feet high, \$6.00 each.
9 in. tubs, 4 plants in a tub, 4 1/2 to 5 feet high, \$8.00 each.

10 in. tubs, 4 plants in a tub, 5 feet high, \$10.00 each.
12 in. tubs, 4 plants in a tub, 6 feet high, \$12.50 each.

Kentia Belmoreana—Made-up Plants.

12 in. tubs, 4 plants in a tub, very bushy plants, 6 ft. high, \$15.00 each.

Areca Lutescens

3 in. pots, 3 plants in a pot, 12 to 15 in. high, \$1.25 per doz.; \$10.00 per 100; \$90.00 per 1000.
4 in. pots, 3 plants in a pot, 15 in. high, \$3.50 per doz.; \$25.00 per 100; \$225.00 per 1000.
6 in. pots, 3 plants in a pot, 24 to 26 in. high, \$1.00 each.

Latania Borbonica.

2 in. pots, 60 cts. per doz.; \$4.00 per 100; \$35.00 per 1000.
2 1/4 in. pots, 75 cts. per doz.; \$5.00 per 100; \$40.00 per 1000.
3 in. pots, \$1.25 per doz.; \$10.00 per 100; \$90.00 per 1000.
4 in. pots, 5 to 6 leaves, 12 to 15 in. high, \$2.50 per doz.; \$20.00 per 100.
6 in. pots, 6 to 7 leaves, 15 to 18 in. high, \$6.50 per doz.; \$50.00 per 100.

Araucaria Excelsa—(Norfolk Island Pine).

Our stock of Araucarias is very complete in all sizes; we are especially strong on the smaller sizes which are now so popular. The plants are all of good value, and will be found a profitable investment to grow on for Winter sales.

4 in. pots, 5 to 6 in. high, 2 tiers, 40 cts. each.
5 in. pots, 8 to 10 in. high, 3 tiers, 65 cts. each.
6 in. pots, 12 to 14 in. high, 3 to 4 tiers, 75 cts. each.
6 in. pots, 14 to 16 in. high, 4 tiers, \$1.00 each.
6 in. pots, 16 to 18 in. high, 4 tiers, \$1.25 each.

Araucaria Excelsa Glauca.

5 inch pots, 8 in. high, 2 tiers, 75 cts. each.
6 in. pots, 13 to 15 in. high, 3 tiers, \$1.25 each.

Araucaria Robusta Compacta.

6 inch pots, 8 in. high, 2 tiers, \$1.00 each.
6 in. pots, 10 in. high, 2 to 3 tiers, \$1.25 each.
6 inch pots, 12 in. high, 3 tiers, \$1.50 each.

Fine Ferns

NEPHROLEPIS BOSTONIENSIS.

(The Boston Fern) 6-inch pots, 50 cts. each.

NEPHROLEPIS SCOTTII.

(The Scott Fern) 6-inch pots, 50 cts. each.

NEPHROLEPIS WHITMANI.

The Improved Ostrich Plume Fern.

Unquestionably the most valuable of this type superseding Piersoni, Barrowsi and Elegantisima all of which we have now discarded in favor of this variety. Not only is the pinna on the individual fronds more finely divided, but the fronds are denser, broader and more graceful and the habit of the plant is more perfect.

2 1/4-inch pots, 75 cts. per doz.; \$5.00 per 100; \$40.00 per 1000.

6-inch pots, 75 cts. each.

NEPHROLEPIS AMERPOHLI.

This is the latest addition to the Ostrich Plume type and is certain to prove a welcome and popular variety, holding for delicacy and gracefulness the same position among the Nephrolepis that Adiantum gracillimum does among the Maiden Hair Ferns. The pinna is so finely divided that it reminds one of a piece of fine lace, the fronds are broad and of a depth which gives them a cushion-like appearance. It forms a beautiful specimen and is admired by everyone who sees it. We are now hooking orders for September delivery.

50 cts. each; \$3.50 per doz.; \$25.00 per 100; \$200.00 per 1000.

NEPHROLEPIS TODEAOIDES.

Todea or filmy Fern-like Nephrolepis.

This is an English introduction that has received a first class certificate both from the Royal Horticultural Society and from the Royal Botanic Society of London, and is likely to become a most important commercial variety. While in a general way it reminds one of an exceptionally well-grown plant of N. Elegantisima it is entirely distinct from this and all others, in its strong yet compact growth and its bold heavy foliage which is distinctly tripinnate or three times divided. Specimen plants which we now have growing are admired by everyone and we have great faith in its future.

4-inch pots, 50 cts. each; \$5.00 per doz.; \$40.00 per 100.

6-inch pots, \$1.00 each.

NEW DOUBLE BLUE LOBELIA.

Kathleen Mallard.

A charming plant of English introduction, which we are now offering for the first time. It originated as a chance seedling from Lobelia Speciosa and has very large double flowers of an intense rich deep blue color. It is a most desirable plant, which meets with favor with everyone who sees it. We offer good plants for propagating purposes.

20 cts. each; \$2.00 per dozen; \$15.00 per 100.

Begonia Gloire de Lorraine

We are now delivering first class stock of Begonia Lorraine, 2 1/4 inch pot-plants which have been propagated from leaf cuttings and which will make plants that are much superior to stock grown in the ordinary way. You will make no mistake in placing your orders at once; the stock is certain to please you.

\$2.00 per doz.; \$15.00 per 100; \$140.00 per 1000.

For the most complete list of seasonable stock that can be offered at this season of the year see our current Wholesale List. If you have not received a copy it will be mailed to you on application.

OUR EXHIBIT AT THE CONVENTION.

During convention week we will have on exhibition at Horticultural Hall a full line of samples, embracing not only the plants offered above but also many others some of which are certain to prove useful to you in your business and with which you should become acquainted. Our entire staff of travellers will be in attendance and will be pleased to show samples or to pilot you to our nurseries at Riverton, where a personal inspection of our many specialties will prove interesting.

AN INVITATION TO ALL.

Wednesday afternoon, August 21, has been set aside by the entertainment committee of the Philadelphia Florists' Club for a visit to Riverton, and we extend a cordial invitation to everyone to join us on this day. A large steamboat capable of accommodating 3,000 people has been engaged by us for the purpose. The trip up the Delaware River is a most interesting one, and will enable you to gain a good idea of the vast shipping, shipbuilding and many other of Philadelphia's great river-front industries. We will do all that we can to make this day a memorable one in the history of the Philadelphia Convention and we hope that you will be able to join us.

Y.; 20 miles from New York, near railroad station; trolley lines within one minute's walk. First-class opportunity for the right man. Plenty of landscape and jobbing work. The place contains four acres, 2 greenhouses, 104 feet long, and lots of sash; well stocked with trees and shrubs, etc.; horse, wagon and tools. This place must be seen to be appreciated. Address, Box 44, Larchmont, New York.

NOTICE

NO DOUBT the Florists and Gardeners throughout the country are aware of the fact that the Greenhouse Steam Fitters and Helpers Local No. 90 have been on strike since June 15 and I hope that anything contrary to the above can be seen in this advertisement. Some of the firms are going around even now telling the craft that the strike is settled, but I can assure you such is not the case, as up to this writing only one boss has signed our agreement, the said firm being Mr. W. H. Lut-ton, who is ready to supply the demand for first-class fitters and helpers of Greenhouse Fitters and Helpers Local No. 90 International Association. T. A. COSTELLO, Secretary Greenhouse Steam Fitters and Helpers Local No. 90.

FOR SALE

We can furnish everything in new material to erect any size house. Get our prices.

METROPOLITAN MATERIAL CO.

Greenhouse Wreckers

1338-1408 Metropolitan Avenue, BROOKLYN, N. Y.

FIRMS WHO ARE BUILDING.

WABASH, IND.—Conner & Ulsh have commenced the construction of a new greenhouse, 125x30 feet, to be devoted to carnations.

NEW LONDON, WIS.—The Olson greenhouse establishment is being enlarged, and next Spring it is intended to add two more houses of the size of those now being completed.

ADAMS, MASS.—A. J. Bootman has torn down one of the old buildings at his place of business on Summer street, and will erect a new greenhouse, 26x40 feet, which will be 16 feet high.

CHANGES IN BUSINESS.

ATLANTIC, IA.—L. Fancolly has purchased 20 acres of land here, and will engage in the nursery business.

AUBURN, CAL.—Gerald Geraldson and S. T. Watts have purchased the business of the late William Watts.

TOLEDO, O.—The firm of Krueger Brothers has been incorporated for \$50,000. The incorporators are Henry Otto, William, Agnes and Julia Krueger. The company has secured a suitable location on the East Side and will begin business in a short time. The firm will cultivate and deal in flowers, plants and shrubbery.

Our London Letter.

BY A. HEMSLEY.

LILIUM LONGIFLORUM.—During the last few weeks prices on these have fallen very low, but I find this does not deter those who make a specialty of them from continuing a succession. I recently visited one large nursery, Mr. Holdrop of Welling, Kent. Here I found house after house full of plants in various stages of growth; and out of doors there were many thousands to follow on. I noted one house where the side benches were filled with bulbs in 3-inch pots; these were well advanced and looked very promising. Growing them in these small pots is a new venture, but florists who have seen the plants have placed orders for the first that came into flower. Pots often have to be used where space is limited.

SWEET PEAS.—A few years ago it was considered early to have sweet peas in time for the Temple show; now we are getting them nearly the whole year through. Earlier they were not of the best quality, but from the first week in May there was a great improvement. I am afraid, however, supplies are over large, and prices can hardly be satisfactory to growers; and when we get surplus supplies, which are hawked in the streets, it detracts from their value for choice work. I find Mr. Breadmore, of Winchester, is already showing new varieties. Of these Etta Dyke is a promising white; Miss A. M. Linzee, a fine shade of pink of the Spenser type. The Prince of the Asturias is already honored with one being named after his Royal Highness; this is a large dark variety of the Black Knight type, with a bronzy shade on the large, round standard. There were four large blooms on each of the stems of those shown. Good pot plants of the early form of Blanche Ferry are seen in the market; grown in 5-inch pots and about fifteen inches high, they are very pretty.

VERBENAS IN THE MARKET.—Since the variety Miss Willmott was first grown for market (as a flowering plant) we have had several other additions, but I doubt if any other sort will make such good prices as the one named. This season the first that came in realized 15 shillings per dozen for well flowered plants. This verbenas varies a little in color, and we have some improved selections; New Pink is one of the best of these. The King, an earlier selection, is another, but this does not appear to come in so early, and the flowers though large and of a pretty shade, do not open out quite flat. Queen of Whites is a good variety, also King of Scarlets, and the deep purple blue Princess of Wales is a favorite. At the last meeting of the Royal Horticultural Society, Messrs. H. B. May & Sons, Edmonton, exhibited an interesting collection of what were termed "auricula-eyed" verbenas; they were certainly very pretty and consisted of various distinct colors, all having well defined white centers to the flowers. Among the best sorts noted were: The Queen, rosy pink; Model, heliotrope; Adonis, scarlet; Vulcan, crimson, and Admirable, claret. It is clear that these old-time flowers are much appreciated; many orders were booked for them, which is the greatest recommendation for them.

In growing for flowering in pots I have found the chief points are plenty of air and light, good compost, and liberal supplies of liquid manure as soon as the pots are well filled with roots. And they must have all the shoots stopped at the same time, so that all flower together (or as near as possible). To get them in early, several plants may be grown in each pot; this prevents the necessity of stopping so many times.

Melons Under Glass.

(Read before the Morris County Gardeners and Florists' Society, by Robert Tyson.)

Good, well-finished melons are considered by many one of the best fruits raised, especially during the summer. The worst enemy of melons in the way of insects is red spider, but if syringing the plants and damp-summer. The houses in which they are to be grown should be thoroughly washed and painted if possible, to insure getting rid of insects. The time for sowing the seeds depends on when the fruit is wanted, the crop taking from start to finish about three

same temperature, to insure sturdiness. When they are well rooted in threes, they may be planted or potted on to a larger size as circumstances require.

A bed, 6 inches deep and 10 inches wide, formed between two boards and made up of good loam, with a little wood ashes or charcoal mixed through it, will be sufficient to start with. Make it firm but not too hard that the water cannot percolate easily, and plant about 28 or 30 inches apart. Keep the house at a temperature of 70 degrees nights, with a rise of 10 degrees by sun heat; ventilating on all favorable occasions, but avoiding cold draughts. Syringing overhead twice a day and careful watering are essential, until the young plants have started in the bed, when they will need a stake to carry them to the trellis. In placing the stake be careful to keep it well away from the ball of roots, otherwise many may be cut off.

Tying now must be attended to, and all laterals pinched out, until the trellis is reached, after which they will be trained to the wires. When the plant reaches the top of the wires, the point should be pinched out to encourage the side shoots to grow freely.

Most varieties show the female or fruiting flowers at the first leaf on the lateral, these ought to be pinched at the second leaf or one beyond the flower; others which do not show ought to be pinched at the first leaf and let break again, which they will do on the sublateral.

As the flowers open a drier atmosphere will be beneficial, and about noon each day, if the pollen is dry, artificial fertilization must be resorted to, either by means of a camel's hair brush or by detaching the petal from the male flower and inserting it into the fruiting flower, all of which is easily understood. After a set has been obtained, thin to the required number, two or at the most three, to a plant, taking care that they are all of one size, otherwise some will swell at the expense of others.

At this stage examination of the bed may disclose a mass of roots; in this case, open out the boards three or four inches and fill with soil—the same mixture as they are planted in with the addition of a 6-inch potful of Clay's fertilizer, added to each wheelbarrowful of soil—covering any roots which appear on the top of the bed as well.

In a few days, or when the fruits are the size of a croquet ball, some support will be necessary, either by pieces of net or boards (nets preferable). If boards are used a hole in the bottom should be made to let away any moisture.

When the fruit is swelling do not allow the plants to suffer for water, also avoid letting the bed get too dry before watering, or cracking of the fruit will follow. After they are rooted through all the soil some weak manure water will be helpful, increasing the strength and changing it occasionally, if the fruit is wanted large, but discontinue feeding and diminish the water supply when the fruits have finished swelling and show signs of ripening.

Syringe and ventilate freely at all times, and when the fruit is ripening a little air left on all night, if the temperature stands above 65 degrees, will improve the flavor.

If the houses is properly attended to, there will be little trouble. If the insect should get a start, XL-All insecticide, 1 in 40, will clean it out and do no harm to the plants. The same dose is recommended for green or black fly. Canker is sometimes troublesome, and if it puts in an appearance, a little dry lime or powdered charcoal rubbed over the affected parts will arrest it. But prevention is better than cure, so don't syringe too late in the afternoon but what the leaves can dry before night, and don't water too near the stem of the plants. The fruit will show signs of ripening by cracking around the stem, and when it is cracked all around cut the melons from the plant and keep in the fruit room 24 hours before using, which will also help the flavor.

The best varieties, in my opinion, are for green fleshed—Royal Jubilee and Sutton's Ringleader; scarlet fleshed—Sutton's Superlative; white fleshed—Hero of Lockinge and Sutton's Perfection. All the varieties mentioned are English, which are, as we find, better adapted for indoor culture than the American sorts—not so much in point of flavor as for thickness and firmness of flesh; and of all the varieties we are growing and have grown, Royal Jubilee is the best, being a good grower, a free setter and of fine flavor, the plants carrying two and three fruits which will average from five to eight pounds each.

The Dresden (Germany) Exhibition.

The accompanying views of the outdoor horticultural exhibition recently held at Dresden, give an idea of how things in this line are done in Germany. The statuary interspersed among the plants gives an imposing effect. We are indebted to Harry Bayersdorfer, Philadelphia, for the photographs from which our illustrations are reproduced.

months. Begin by sowing good plump seeds, singly, in 3-inch pots, in good fibrous loam; put the seeds in a temperature of 70 or 75 degrees, and in about a week germination will have taken place. Keep the young plants as near the glass as possible, in the

Group of Boston Gardeners at Trial Grounds of W. W. Rawson & Company (See Boston Letter, page 131)

Fern For Name.—I send you a fern frond; please tell me the name of the plant. I think it is a sport.
 Virginia. S. W. C.

Your fern is not a sport, but an old variety named *Pteris serrulata cristata*.

(7) Nitrate of Soda for Chrysanthemums.—Please state how much nitrate of soda to use for chrysanthemums, per thousand gallons of water, for the best results.
 Mass. P. B.

—Nitrate of soda for chrysanthemums should be used at the rate of one ounce to each four gallons of water; this would mean 15 pounds 10 ounces to 1000 gallons.

(8) To Preserve Hardy Ferns.—What is the best way to preserve hardy dagger ferns in large quantities for Winter use? These, of course, are the cut ones to be used for various calls during the season when they are unavailable outside.
 New York. FLORIST.

—The best way to preserve hardy dagger ferns is to tie them in bunches of twenty-five and lay them flat in boxes, placing these in some cool cellar; or if that is not convenient, put them in cold storage where a temperature of less than 40 degrees, but not lower than freezing point, is maintained.

(9) White Fly on Grapes.—Kindly inform me how to clear my grape houses of white fly.
 WANDERING JEW.

—Pyrethrum powder dusted on the foliage with an ordinary powder bellows has been found very effective in keeping white fly in check. Perhaps some reader can suggest a better remedy, however, as these flies are difficult to handle when they become very numerous.

(10) Manure for Carnations.—Will carnations do as well with pulverized sheep manure and ground bone as cow manure, and what quantity must I use to get good results?

Mass. SUBSCRIBER.

—Good carnations can be grown by using sheep manure and ground bone; just as good, no doubt, as can be obtained with cow manure. Use the sheep manure in the proportion of one to ten of good, fresh loam, and when the benches are being filled, add a 5-inch potful of ground bone for each wheelbarrowful of soil, mixing thoroughly.

(11) Treatment for Callas.—Please give me directions for potting callas and state what manure to use for best results.
 Mass. SUBSCRIBER.

—As soon as the calla tubers are received, pot them in 5 or 6-inch pots, using a soil composed of one-fifth well decomposed barnyard or stable manure, and four-fifths good, fresh loam. If the manure mentioned cannot be obtained, then use well pulverized sheep manure, using but half the quantity specified above. After the potting is completed and a good watering given, the pots may be placed outdoors in a sheltered situation where they will get neither the full force of the sun nor heavy rains, until growth is well under way; then remove them to the greenhouse. After the first flower is produced, the plants should be potted into larger sized pots, using the same kind of soil as before recommended. When the plants become root-bound after receiving the final shift, a good watering with liquid manure, afforded once a week, will help materially in producing flowers.

LONDON, ONT.—Business is almost at a standstill; except for a little funeral work there is nothing doing in the retail line. Cut flowers are very scarce, carnations and roses, being over for the season, and asters and other outdoor stock are not ready yet.

The gardeners of London will hold their annual picnic on July 31 at Springbank Park. The florists have postponed their picnic till convention time.

F. C.

THE STANDARD TREATISE ON GARDENING.

THE GARDENER'S ASSISTANT

New Edition.

UNDER THE DIRECTION AND GENERAL EDITORSHIP OF

WILLIAM WATSON

Curator, Royal Gardens, Kew.

Thoroughly Up-to-Date; The Recognized Authority on Gardening; Most Distinguished Contributors; Lavish in Illustration; Indispensable to Practical Florists and Gardeners, to Country Gentlemen and the Amateur. A Complete Encyclopedia of Gardening. The Leader Among Gardening Books.

For the past half-century **THE GARDENER'S ASSISTANT** has maintained its unique position as the standard treatise on practical and scientific horticulture.

The publishers in this new edition have given this monumental work such a complete remodeling, revision and extension as will enable it to hold in the twentieth century the place which it worthily filled throughout the latter half of the nineteenth. It is so thoroughly up-to-date, and is so comprehensive in scope, as to constitute a complete encyclopedia of all that is known about the science and art of gardening. No one who wishes to excel in gardening, either as a business, or a hobby, can afford to be without it.

THE GARDENER'S ASSISTANT is a compendium of all operations of the garden and arboretum; from the formation of the garden and plant-houses to the cultivation of all kinds of plants, whether for use or ornament: trees, shrubs, herbaceous and alpine plants, stove and greenhouse plants, orchids, ferns, succulents; fruit, both under glass and in the orchard or kitchen-garden, and vegetables of all kinds.

Everything has been done that could be done to elucidate the text by the free use of illustrations. These represent recent gardening appliances, houses, heating apparatus, flowers, trees, diagrams, schemes for laying out the garden, methods of pruning, etc. In fact, wherever a picture would be useful a picture is given. Moreover, in addition to the black-and-white text illustrations, there are twenty-five full-page black-and-white plates, and eighteen colored plates of flowers and fruits, specially prepared for the work by eminent artists.

THE FIRST PORTION of the work deals with **GENERAL PRINCIPLES**; **THE SECOND PORTION** is devoted to directions for the **CULTIVATION OF DECORATIVE PLANTS OF ALL KINDS**—stove, greenhouse and hardy trees, shrubs and herbaceous plants; **THE THIRD PORTION** treats upon **FRUIT CULTIVATION** in all its branches, both under glass and outside; and **THE FOURTH PORTION** upon the **GROWTH AND MANAGEMENT OF VEGETABLES AND HERBS**.

THE GARDENER'S ASSISTANT has been made the **SOUNDEST** and **MOST PRACTICAL**, as it is unquestionably the **NEWEST** and **MOST UP-TO-DATE**, Book on Horticulture.

SEND FOR PROSPECTUS.

We have obtained the exclusive right to the sale of this invaluable work in the United States. It is elegantly printed, on thick, durable paper, in two handsome imperial 8vo. volumes, substantially bound in Roxburgh, half leather, cloth sides, marbled edges, about 1300 pages.

PRICE, delivered free, by express, to any part of the country, cash with order, \$15.00. Money refunded if not satisfactory. Or, we will send purchaser the two volumes on receipt of a first payment of \$4.00 and six monthly payments thereafter of \$2.00 each.

News Notes.

We had one lone visitor the past week—Julius Dilloff, traveler for Schloss Brothers of New York. Mr. Dilloff reports a big sale of ribbons.

Alex. Siegel, with his family, is enjoying the cool breezes up North; they will return the latter part of August.

George Waldbart will spend the rest of the Summer traveling in Europe. Mr. Waldbart left here last Wednesday night and will miss his first convention in years.

The wholesale baseball team will practice every Saturday afternoon from now on so as to be in trim for any team that comes along. The bosses have promised to buy them new suits.

Club Picnic.

The Florists' Club's annual picnic, held at Ramona Park, Thursday, July 25, was a picnic in the full sense of the word and had by far the largest attendance of any outing ever given by the club. As early as 9 a. m. the members began to arrive and by 2 p. m. nearly 400 were on the grounds. The reception committee was composed of Messrs. Fillmore, Schoenle and Beneke. The day was perfect but very hot—the first one in years when we did not have rain. The young folks were out in large numbers and the old folks were not far behind. The morning was taken up in selecting shady places for lunch. While the young folks danced some took to fishing, others to a ride on the lake. After 12 o'clock the largest crowd came out, as all the wholesalers and some of the retailers closed up shop.

Trustees Smith and Beyer were on hand to welcome the members and their families and friends. Frank Weber, the other trustee, is still laid up at home with a sprained foot.

The band engaged played delightful music, much to the enjoyment of the young people who had the dancing pavilion all to themselves.

At 2:30 p.m. Chairman Smith announced that the games would take place.

In the 100 yard dash, open to all, A. Hartman won the first heat and Fred Alves the second; the final was won by Mr. Hartman.

The second event was 100 yard run for fat men; none could be found, so the race was declared off.

Fifty yard race for girls under 16 years—Miss Alice Musick.

John Bentzen won the next 100 yard race for boys under 16 years.

In the potato race for boys and girls Joe Kerr won among the boys, and Alice Musick won in the girl's contest.

Fifty yard egg-and-spoon race—Mrs. W. J. Pilcher of Kirkwood.

Fred Alves was an easy winner in the hop-step-and-jump contest.

In the race for young ladies, 16 years and over, Miss Rose Winkler won in a walk.

Edwin Lammen won in the race for little boys under 12 years.

The tug of war proved the most exciting event of the day; a team of heavy-weight florists from Kirkwood outpulled a team of St. Louis florists.

Miss Minnie Trockenbroch won the ball-throwing contest for ladies.

The flower-pot-breaking contest was won by Mrs. Theo. Klockenkemper.

This closed the games and everybody went to the hall grounds to see the game between the wholesale team and a team composed of employees of C. Young & Sons Co., known as the retail team. Each side had its rooters. After a hard fight for five innings, the game was called with the score 11 to 5, in favor of the wholesalers. The Young team protested for nine innings, so all bets were declared off, though the wholesalers won the prize. The game will be played over some Saturday afternoon at one of the big ball parks.

After this the evening was spent in dancing and boating, and not until 10 p. m. did the large gathering break up and leave for home.

We missed some of the old timers, like Emil Schray, Charles Juengel, Frank Weber, Henry Ostertag and others. The singing of Miss Nellie Broe was excellent, especially her rendition of the song "Love Me and the World is Mine."

REVIEW OF THE MARKET

NEW YORK.—Toward the end of last week and the beginning of this one the market assumed a more lively aspect, but the spurt was only temporary, and taken as a whole, the averages will be no higher than those recorded in last issue. There has been a slight increase in values in the case of American Beauty, which in a limited number of instances this week reached 20c.; but the large majority have been sold at the prices quoted in our table. Stock, generally, in roses and carnations, has not been any too plentiful, yet it has been sufficient for all demands. There is an immense supply of gladiolus now reaching the market, and it has been difficult to move it satisfactorily.

CHICAGO.—A somewhat healthier tone has pervaded this market for the last week, everything that could be classed as good being pretty well cleaned out shortly after arrival and the quantity of inferior stock presented, especially in carnations, having been greatly reduced, probably to a minimum. The absence of the aster glut, which generally exists at this season, gives the general market an aspect of bareness very seldom seen here.

Prices have not changed much, though stock moves more readily, and as shipping appears to show a slight improvement it is probable that the conditions which prevail here are reflected throughout the shipping district.

There are comparatively few good American Beauty roses coming in now, and Bride and Bridesmaid are particularly lacking in quality. K. A. Victoria are probably the best conditioned roses that reach the market, though some very good Killarney are noted.

Peonies are still to be had, though several of the largest handlers of cold storage goods have exhausted their stock while others state that at the present average demand on their supply they can hold out to about the middle of August.

Asters are becoming daily more plentiful, and though there is no evidence of a glut there appears to be enough to go around.

Gladiolus and auratum lilies are in ample supply, and may be noted as among the best stock in sight.

Green goods of all kinds in season are sufficiently abundant. W. K. W.

NEWPORT, R. I.—The market is well supplied with all kinds of outdoor flowers. Sweet peas are in extraordinary supply just at present, of a quality on the whole not up to the usual standard. Antirrhinums are offered in large quantities at rather low figures for long stemmed flowers, but there are so many grown here this year that any price is taken. American Beauty roses are coming in of very good quality considering the weather of the past week or two. There is all through the Summer a good demand for this rose, they being considered the highest toned and most superb flowers for the decoration of dinner tables at select party entertainments. There is, as usual, a large demand for orchids, larger than the local supply can meet. In fact, all the orchid flowers grown here for sale do not amount to anything worth mentioning. Last week the funeral of a popular and prominent Cleveland society man called for large numbers of choice flowers to be made up into funeral pieces. Leikens alone used over 250 orchid flowers on that occasion; only about twenty-five or thirty did he pick up around here, the rest he procured from Boston and vicinity. One or two growers went in largely for stocks this Spring; now they are selling very well. They are of good quality and look very desirable for odds and ends in general florists' work.

Plants are still selling remarkably well. Well colored crotons and dracaenas take the lead. Dracaena amabilis is especially catching; this variety when full grown is almost entirely white in foliage with the exception of a golden tint, the deep green midrib only intensifies the gaiety of the color in the main. Palms are still in good demand at prices slightly in advance of what they cost at retail this time last year, good arecas are rather scarce and specimen kentias of the Belmoreana variety the same. Hydrangeas in tubs of a size convenient for moving from place to place are valuable stock now, and from now on as long as they will be in bloom; these are exceedingly serviceable to florists because they are useful for large decorations and can be used over and over again and still remain as serviceable as ever. D. M.

INDIANAPOLIS.—With the Summer season passing rapidly away it becomes evident that the amount of business transactions will be fully equal to that of former years. The flower shop is not altogether a forgotten quantity; this is demonstrated by the regular quantities of funeral work, also a noticeable increase in regular counter trade each pleasant shopping day.

It still behooves the grower of Summer flowers to put forth greater efforts, as stock does not compare favorably with the demand even at this dull season. Good products of almost any variety are always saleable at top notch prices. Asters, thousands of them, are brought to market and it is only the poor ones that remain; 75c. to \$1.50 a hundred is obtained for them.

Lilies still play a prominent part in the flower market; several of the growers are fortunate with cold storage bulbs. Roses, particularly the better grades, are scarce. Supplementary orders are sent the outside growers frequently as the home grown supply is not to be relied upon; \$3 to \$7 a hundred is being paid for the best Liberty, Kaiserin Augusta, Victoria and La France. American Beauty are very small and unsatisfactory at \$3 to \$20 per hundred. Shasta daisies and Golden Glow are among the favorite garden flowers. A good gladiolus season is promised; \$3 a hundred is asked for fancy light colored ones. Short-stemmed dahlias are arriving, at \$1 to \$1.50 per hundred. There is absolutely nothing offered in the blooming plant line that would meet the expectations of the regular flower buyer.

ST. LOUIS.—There is very little to say regarding the market as the business done at the leading retail stores is reported as very dull, except for a funeral order here and there; and maybe it is just as well, as very little stock of any kind is coming to our market. Fancy grades are out of the question, and about the only things worth while laying in a stock of are asters, gladiolus and a few tuberose stalks.

As to roses, the highest price they bring now is \$5 per 100, and the quality is nothing extra at that. Bride and Bridesmaid are very poor, hardly fit for any kind of work. A few fairly good Killarney and Ivory are arriving; these are graded into lots at \$5, \$3 and \$2 per 100.

Carnations are equally as bad; hardly enough are in the market for the demand, at \$1.50 to \$2 per 100. A fine lot of asters is coming in, and, when good, sell at from 50c. to \$2 per 100. An abundance of gladioli stalks are coming from Kirkwood, and there is a great demand for the lighter shades which can be used in any kind of work; these bring \$3 per 100 and \$2 in 1000 lots. ST. PATRICK.

BOSTON.—Business has been at a standstill except for such flowers as might be required for funeral work. Roses are poor, but then they are getting scarcer and prices are somewhat firmer. Carnations are fairly good for this season, the raft of poorer flowers having subsided. Gladioli are good at \$1 and \$1.50 per dozen for the best grades. There are a few lilies which bring \$10. Lily of the valley sells at \$2, \$3, and \$4. Asters are as yet not very plentiful selling at \$1 to \$2. Sweet peas are abundant and cheap. There are lots of other flowers in bunch lots, but these have a very limited demand. J. W. D.

ST. PAUL.—Business the past few weeks has been very quiet. There is some movement in Summer flowers but not sufficient to help matters much. Funeral work from country towns has been very brisk. Stock is not plentiful, and it will be at least from two to four weeks before we get any kind of a fair cut from the rose plants. Carnations are, of course, very small, and the price varies considerably.

Very little building is being done, the work in the greenhouses being practically all repairs. Unless there is some early movement in that direction, this year's building will fall away short of last year. ST. PAUL.

PHILADELPHIA.—There is very little business doing in cut flowers, and about sufficient stock is coming in to fill demands. American Beauty are selling at \$2 and \$3 per dozen, a few at \$3.50. Asters bring \$2, the top price; lily of the valley, \$3 and \$4 per 100. Cattleyas realize 50c. and 60c. per flower. In roses Killarney are fetching \$2 to \$4 per 100, a few going at \$5; Kaiserin Augusta, Victoria, \$6 to \$8 per 100, but only a few at the latter price. DAVID RUST.

Buffalo, N. Y.

The Pennsylvania Railroad will run 15-day excursions to Atlantic City, Cape May and other points, August 2, 16, and 26, 1907. The fare is \$10. A stop-over of ten days will be allowed at Philadelphia on the going trip, if passengers deposit their tickets with the ticket agent at Broad Street station, Philadelphia, immediately after arrival, and on return trip within limit, without depositing tickets. Tickets will be good for passage returning on all regular trains, except Pennsylvania Limited, Chicago Limited, St. Louis Limited, and the Pennsylvania special, leaving the seashore and Philadelphia within fifteen days, including date of excursion, when properly validated by agent at seashore destination. The date of August 16 will fit the S. A. F. O. H. convention, to such as would feel inclined to start that early, and the rate may be noticed as gaining somewhat over the \$9.25 fare and third. The route, via Buffalo, might also fit some of the common excursions to Niagara Falls. D. B. LONG.

Indianapolis.

News Topics.

Louis Hoerger feels almost like forsaking the flower business and turning his attention to vegetables; his green onions, he claims, have paid something like \$300 per acre.

It seems that a delegation from this city to the S. A. F. O. H. convention is an impossibility; several have signified their intention of going but the boys will not travel together as usual.

W. W. Coles of Kokomo is replacing several old houses with a large one of King construction; this will embody about a third more space.

A. P. Gray, Spencer, Ind., is shipping many gladioli to this city.

A. Lange has the best asters to be seen at Tomlinson Hall market.

John Chisholm is spending his vacation in Detroit; and Ben Pritchard of Wiegand's is enjoying a ten days' rest. I. B.

GROW MUSHROOMS

If you do not know how, procure that simple but complete and practical book called "How to Grow Mushrooms." The price is ten cents and it can be secured from this office.

Special rates will be made to the trade who wish to supply their customers.

THE FLORISTS' EXCHANGE
2 Duane St., New York

Hartford, Conn.

Death of James Young.

James Young, florist, Cone street, died of lockjaw at St. Francis hospital Friday night, July 26. The trouble started by a rusty nail penetrating the foot while he was working around the greenhouses about a week previous.

Mr. Young was 40 years old and came to this country from England in 1892, settling in Hartford one year later. He was descended from an old family of English gardeners. He had conducted a successful florist business in Hartford for the past eleven years. He is survived by his widow and five children, his father and several brothers who reside in England and one brother, William, in this country, who is gardener for S. W. Robbins of Wethersfield.

Mr. Young was much respected and his funeral was largely attended Monday morning from St. Joseph's Cathedral. He was a member of a number of fraternal and benefit organizations.

Mrs. Young wishes it announced that any concern having orders for any plants, bulbs, etc., to please countermand the orders as it is not decided yet what disposition will be made of the place.

J. F. COOMBS.

NEW BEDFORD, MASS.—We have had a few good showers here of late, and as a consequence vegetation is picking up. Stock is quite scarce but in a week or so, with plenty of asters to help out, things will be different.

Nearly all the old carnation plants in this section have been thrown out; young stock in the field is looking well and will soon be ready for housing.

R. E. Noffty has gone to Germany for a vacation.

E. Y. Pierce is building a boiler pit of concrete; this will be 30 feet in length, 8 feet deep and 10 feet wide. He will also build a new violet house.

Wm. Livesey has installed a Lunt Mors pneumatic water tank; by this means a good pressure is obtained for watering purposes. HORTICO.

Carnation growers who have a surplus of young plants should advertise them in THE FLORISTS' EXCHANGE.

JUST OFF THE PRESS

THE BOOK OF Water Gardening

This book supersedes all other books that have previously been written on the subject of aquatics and their surroundings, and gives in full detail all the practical information necessary to the selection, grouping and successful cultivation of aquatic and other plants required in the making of a Water Garden and its environments, and covering all conditions from that of the Amateur with a few plants in tubs to the large estate or park.

Baltimore, Md.
News Items.

We are now enjoying cooler breezes with heavy rains—quite a relief from the torrid heat and the intense humidity of the early part of last week.

Cut flowers are very inferior in quality. Lilies and other white flowers are much sought after for funeral designs; this stock is very scarce.

Mrs. J. J. Perry is recovering from an attack of appendicitis.

The Maryland Horticultural Society Summer meeting will be held in Jamestown, Va., September 24 and 25.

Messrs. R. Vincent Jr. & Sons Company have changed the dates of their annual dahlia display to September 17, 18 and 19, so as not to conflict with the Jamestown meeting, as a great many Baltimore florists and horticulturists will attend both. Mr. Vincent has again invited the Baltimore Gardeners' Club, as well as all horticulturists and others interested to inspect his dahlias which show great promise at this time.
C. L. S.

GREEN BAY, WIS.—Christoph Meier, father of Carl Meier, florist, died at the home of his son on July 18. He was 84 years of age, and a native of Greifswald, Germany.

(Give us a trial. We can please you.)

Washington, Pa.

Joseph Seaman, who has recently purchased the land and greenhouse of the Washington Floral Company, on July 1, took possession of same. This is a desirable piece of property consisting of forty acres of good land which contains the greenhouses of the now obsolete Washington Floral Company. These houses consist of 25,000 square feet of glass in good condition. There is an oil well for fuel. The greenhouses heretofore operated by Mr. Seaman were leased by him and it is said will be conducted hereafter by another grower about to enter the florist ranks in this city.

Mr. Seaman has an artistically arranged store on one of the principal business streets. A greenhouse in the rear for display and decorative plants is the next contemplated improvement. When this is done according to specifications no more desirable stand can be found anywhere. J. M.

Chas. W. McKellar

ORCHIDS

FANCY VALLEY, ROSES, CARNATIONS,
and all CUT FLOWERS and GREENS

51 Wabash Ave., Chicago

William Lubliner has started for a two weeks' outing at East Round Lake.

Peter Reinberg and Leonard Kill, accompanied by Mrs. Reinberg and Mrs. Kill, have been spending the past week at Salem, Wis.

William La Hayn, Chesterton, Ind., made one of his semi-occasional trips to this city last week. Mr. La Hayn covers a broad field in his pursuits, for in addition to his florist and nursery business he breeds Rhode Island poultry and cultivates small fruits extensively, with which latter branch he has been unusually successful this season, having had good crops, which are bringing nearly double average prices.

Richard E. Gloede, of Evanston, recently entertained the members of his lodge of Odd Fellows at his suburban home, and so highly enjoyable was the gathering that it will be repeated on Sunday, August 11, with the addition to the party of the members' wives and ladies.

Percy Jones is still furnishing his regular customers with cold storage peonies, and says that these parties will be supplied with their allotted number up to August 15, when his stock will be exhausted. As to their condition, he states there would be no trouble in keeping them in perfect shape to September 1, and in speaking of their shipping qualities he cites having recently sent some cold storage stock to Central Florida, where they arrived in excellent condition and gave entire satisfaction, and pertinently asks, "what else have you in the market at this season of the year that would stand that test?"

F. Lautenschlager has adopted the camera as a traveling companion, and has some fine views of greenhouses where the Kroschell boilers, whose virtues he espouses, have been installed.

Visitors to the Jamestown Exposition during September should bear in mind that the National Council of Horticulture will meet there on the 23d of that month, and promises a meeting of great importance, some twenty papers on vital subjects relative to horticultural matters being already scheduled.

Many dealers, both wholesale and retail, make the suggestion every year that it would be more than to their liking if they could close their doors during the dull part of the dull season and take a rest even from the daily expectancy of doing business. Sinner Brothers are trying it; John Sinner, who manages the sales department, concluding that his time could be more advantageously devoted to work in the greenhouses, has closed his headquarters in the Flower Market for two or three weeks; Ben Zalinger has gone on a vacation, and Miss Martha Gunterberg is selling their flowers.

Curt Philipp, who recently married Miss Elly Schurach, has returned from his vacation, and is pursuing his duties as a member of Vaughan's Seed Store sales staff, apparently happy under the new conditions of life.

Miss Rose, daughter of C. A. Rose, the pioneer florist of Wichita, Kan., has been visiting friends here, and also took a trip through the market. Before her return to Kansas Miss Rose will visit friends in Rockford, Ill.

John Kruethen, with his wife and baby, has been enjoying a few days at Fox Lake.

O. Johnson commenced last week to take his peonies out of cold storage, and they are in excellent condition; Mr. Johnson stating that if the market did not call for them they would stand for several weeks longer.

The Chicago Journal gave a successful matinee for the benefit of three worthy charities last week, Friday, at the Colonial Theater, and in its account of the event prominently mentions the contribution of Alderman Peter Reinberg of 500 beautiful Mrs. Marshall Field roses which were sold before and during the performance by four young lady members of this theatrical company.

The Lake Geneva Annual Fair, the great social and horticultural event of the season at that popular resort, was held on Friday and Saturday of last week and was, as anticipated, the success of the season.

Paul Blome & Company of North Clark street have moved into their new store just north of their old stand.

There having been some question as to the decision of the tug of war contest

The Week's News.

Charles Zapfe, of the J. A. Budlong city staff, has been spending the past week at the Budlong Summer home at Lake Geneva.

At a meeting of the picnic committees of the Florists' Club, held on Friday of last week, it was shown that the attendance at the Morton Grove outing was some fifty per cent. larger than that of last year, making it one of the most successful events in the history of the club. With one or two small accounts to come in, the finance committee reported over one hundred dollars surplus which will be returned pro rata to the cash subscribers, making a dividend of about thirty per cent. for their contributions.

At the Poehlmann Brothers Company's store a very large cooler is being installed running nearly across the north side of the establishment, which, when completed, will be over 45 feet 4 inches in length. Orr & Lockett will furnish the new chest.

Carnations are being benched from the field in some houses, and many others are about ready to begin, but are giving the plants all the opportunity to make field growth, which, though tardy, they are doing in fine shape at present. Plants that were benched from pots early in the season, a practice carried on to a very much larger extent in this vicinity this year than ever before, are reported all round as having made excellent growth. The extremely hot weather has made it impracticable to execute a full day's work under glass, and on this account progress has been somewhat delayed. One concern, Weiland & Risch, have tried with success the expedient of working their force of men in this department from 7 to 11 o'clock in the morning, and from 7 to 11 at night, thus avoiding working during the most oppressive hours, which they were enabled to do by the aid of the electric lights, which shine from the street into their houses, and the brilliancy of the moon several evenings last week.

at the picnic, one of the retail team says he is ready to furnish any amount up to \$500 to pull the contest over again.

Fritz Bahr has returned from a trip to Toronto and Niagara Falls.

Charles McNiff, manager of Vaughan's Seed Store greenhouses of Des Moines, Iowa, was in the city, the first of this week.

George Pieser and Charles Balluff, who were disabled during the sports at the picnic, were laid up for a day or two before resuming their duties and the latter has not yet fully recovered from the effects of the strain in his back. The accident deferred his vacation on which he expects to start to-day accompanied by Mrs. Balluff, Miss Eaton and two friends not affiliated with the trade.

E. C. Pruner is spending a couple of weeks in his former home near Cleveland.

C. M. Dickinson returned to business from a pleasant outing at the Wisconsin lakes the first of this week.

O. P. Bassett now owns three automobiles and spends much of his time pleasantly this Summer exercising them.

Recent visitors included, H. A. Curtis of the West Coast Nurseries, St. Petersburg, Fla.; S. B. Wertheimer, New York; A. Loudenberg, Hobart, Ind.; and H. Fisher, Kalamazoo, Mich.

What with moving into his splendid new quarters on the Michigan avenue front of the Auditorium and attending to the numerous duties pertaining to the coming S. A. F. convention Secretary Hauswirth is leading a strenuous life.

Wm. K. Wood.

Washington, D. C.

News Notes.

With the exception of a rather unusual amount of funeral work during the past week, business was characteristically sluggish. The weather was intensely warm, which always tends to depressing effects on trade. Asters are beginning to come in rather more abundantly, but still in insufficient quantity. The scarcity of cut flowers prevailed owing to the heat and lack of rain. It has been four weeks, or more, since rain fell in some of the important local growing sections. This condition had greatly added to the labors of those who artificially irrigated. All crops were suffering.

All florist stores closed at noon on July 25 in order that clerks and proprietors might attend the outing at Great Falls of the Potomac given by the Washington Florists' Club.

Z. D. Blackstone with his family is spending the heated term at Boyds, Maryland, from which place he comes in several times during the week to attend to the more important business affairs requiring personal attention.

Mrs. John Robertson, wife of John Robertson, whose store is located at 1108 Connecticut avenue, sailed on July 27 for Scotland to visit her old home, relatives, and friends, whom she has not seen for a number of years.

Chesapeake Beach, Maryland, is presenting a fine display of bedding plants furnished and looked after by Samuel Hammer and Sons of this city. The work is praiseworthy.

Club Outing.

One of the most highly enjoyable social events in which the Washington Florists' Club ever participated, was held on July 25, at Great Falls of the Potomac, 16 miles above Washington, the terminal of the Great Falls and Old Dominion railroad.

Prior to the construction of this road some few years ago, the inaccessibility of this magnificent spot prevented even many Washingtonians from enjoying its beauties. Now that there is one of the best equipped double track railways, giving excellent service, and connecting the Falls with the National Capital, the place constitutes one of the most beautiful and thoroughly enjoyable side trips around Washington. There are three

great falls merging into one gorge, making a whirlpool which is unsurpassed in natural beauty, south of Niagara. The waters rushing and tumbling, whirling and boiling, at terrific speed amid jagged boulders of rocks, whose perpendicular cliffs rise nearly one hundred feet above, all constitute an awe-inspiring scene never to be forgotten.

In 1785, a beautiful little village, known as Matildasville, was here established, on the Virginia side of the river. General Washington engineered and superintended the construction of a canal around the Falls at this point, and erected a mill and iron foundry. This canal for many years, prior to building the Chesapeake and Ohio canal from Cumberland to Georgetown, on the Maryland side, furnished the only waterway for produce to be shipped from the upper tributaries of the Potomac to seaport towns below. Owing to the many rapids encountered by the barges in their transit, a return trip was impossible; consequently, after disposing of their freight, they were sold.

The foundations of the mill and foundry are still intact, and the canal though long since abandoned as a waterway, could soon be made serviceable. The town of Matildasville has long since passed into oblivion, and but one house of the old colonial type marks the beautiful spot where this thriving town was located. This homestead has for thirty years been operated as an inn for sportsmen, and has in its time entertained many of our most prominent statesmen. This house, now known as the Dickey Homestead, served as headquarters for the Washington Florists' Club. Characteristic of the committee appointed by President Bisset, consisting of Chairman George Schaffer, Secretary McCauley, and F. H. Kramer, an elaborate program was arranged. Cigars and refreshments were served on the trains both going and returning. On the grounds, Queen Beatrix and Liberty roses were freely distributed among the ladies.

The athletic events were as follows:

Potato Race—Open to all—75 yards, Frank Fleury.

Potato Race for Girls—50 yards—Marie Bisset.

One Hundred yard dash for Men—Robert Featherstone.

Fifty-yard Dash for Ladies—Eva B. Cooke.

One Hundred-yard Dash for Boys—18 and under—David Burjar.

Three-legged Race—J. Sharper and B. Johnson.

Sack Race—Oliver Beveridge.

Quoits, doubles—George Cooke and Samuel Simmons.

The only unfortunate incident occurred in the eighth event, when James Hardy, 22 years old, clerk for Z. D. Blackstone, while running the sack race, fell violently to the ground and received painful but not serious injuries to his head.

The old Virginia dinner, served by the Dickeyes, fully upheld the reputation which it has enjoyed for the past quarter of a century.

At 8 p. m. the train laden with the happy florists and their friends started for home. All agreed on a unanimous vote of thanks to the committee in charge, who had so perfectly arranged every detail, for one of the most pleasant outings of the Washington Florists' Club.

After for years having regularly engaged the services of a score of men with scythes in order that the forty-acre lawn surrounding the National Capitol might be kept mowed, Uncle Sam has purchased an "auto mower" to do the work. Where hand labor took from ten days to two weeks to cut the grass, in which time it was necessary to begin again, the "auto" does it creditably in three days. The automatic cutter cost the Government \$1,500. It is claimed it will pay for itself in one season, considering the expense previously involved. It weighs 2,200 pounds, and is driven by gasoline. The motor moves and works nicely, and is estimated to do satisfactorily the work of 15 or 20 men.

Louis Hoover of the firm of Mayberry & Hoover, 1339 Fourteenth street, is spending a month at St. George's Island on the lower Potomac.

News Notes.

Frank J. Schoen of the Schoen Floral Company was married to Miss Grace Howes of Maumee, O., on April 9, at the Church of the Immaculate Conception. Though this happened so long ago, the news has only lately leaked out. We all wish them the best luck.

H. A. Mills intends to sell his place; he is getting along in years and thinks that he and his wife deserve a respite from active work for the rest of their lives. S.

Cincinnati.

News Notes.

Business would be good if there was any stock to do business with. Asters have made their appearance here in limited quantities, and we hope the coming week will see an increase of stock as well as in trade.

The trustees of the Jabez Elliott Flower Market are having some needed repairs made on the building. Cincinnati is justly proud of her flower market, and the trustees see to it that it is kept in good repair at all times. George Walker, who is the superintendent, most faithfully attends to his various duties; he is always found at his post.

Uncle John Fries and wife left Wednesday morning for quite an extended trip. Chicago, Kansas City, Denver, Maniton and Salt Lake City will be visited before they return.

J. A. Peterson and wife left Sunday for New York, and will sail August 1 for a trip of several months abroad.

Mr. Elberson, New Brighton, Pa., was a caller Friday. He says the flower pot business is good, and that he has extended his plant so that no order is too large or small for him to fill.

Sidney Wertheimer, New York, the ribbon man, was also in town, as was Mr. Shattels, representing Lion & Company, also ribbons, New York; C. S. Ford, of Philadelphia, representing himself and many others, was also a caller. George H. Fulle, of Fulle Brothers, Richmond, Ind., was in the city on Saturday.

I take pleasure in announcing the en-

OUTLIVED USEFULNESS.

You are quite right, it is not so many years since we used to talk wooden eave plates and sold lots of houses with them—but we had our troubles because those wooden plates gave our customers “rot out” and ice troubles. We did a good bit of tall thinking and now you will find our houses are built with steel eaves and cast iron roof bar brackets. This makes an eave which binds and stiffens the house at a point that is the weakest in the all-Cypress house. There is a long-headedness in knowing when a thing has outlived its usefulness, and having the sense to discard it. The wooden plate is a back number; write to H. and Co. for further information.

HITCHINGS and COMPANY

GREENHOUSE DESIGNERS AND BUILDERS. Manufacturers of Heating and Ventilating Apparatus
1170 Broadway, New York

Jamestown, N. Y.

The Lake View Rose Gardens are possibly the most extensive to be found anywhere in the Eastern States. When the new additions to the already large area of glass are completed early this Fall this company will have over one million square feet of glass devoted to the production of cut flowers for the wholesale market only. There is now in the course of construction a range consisting of about 355,000 square feet of glass; this added to about 800,000 that has already been in operation for some years gives this company in point of glass area a prestige few if any other establishments this side of the Alleghenies enjoy.

This company started nine years ago with six 300-foot and four 200-foot houses and has increased its capacity every season since the beginning. The present additions are, however, on a larger scale than on any of the former occasions, denoting a healthy condition of business in this particular line.

Mr. Roney is the manager of this place and took pleasure in giving your correspondent some details of the extent of business done.

They lay claim to be the largest growers of lilies in America, forcing annually over 100,000 bulbs for Easter as well as a supply in lesser quantities during other portions of the season. About 80,000 roses are grown, 200,000 carnations, 20,000 violets, 50,000 smilax, and 100,000 Asparagus plumosus. During the improvements going on at the time of my visit there were 104 men at work on the place. It takes when improvements are complete a force of about 75 men to keep the place in running order in both the growing, packing, and all the many other details of work to be done.

The company has about 75 acres of land on which the greenhouses are located. This is used for soil, and growing outdoor stock. The remainder is allowed to go to hay for the horses. It takes 16 horses to keep this establishment going in the hauling of manure, soil, coal and lumber. Most of the construction work is done by the company's own men. Carpenters, painters, steam fitters and electricians are on the firm's pay roll all the season through. All the power used is electricity, and the houses and packing and storage rooms are all lighted by electricity.

The product of these greenhouses is shipped as far west as Cincinnati, east to Boston, south to Pittsburg and north to all points from Buffalo to Montreal along the St. Lawrence. They have 1,500 steady customers and issue a weekly price list of their stock to all interested. Mr. Roney says he has applications from two customers to know if he could not guarantee them the entire cut from 25,000 to 50,000 Asparagus plumosus for the coming season.

A. N. Broadhead is the financial head of the Lake View Rose Gardens, whose ambition is to have one of the largest commercial places on the continent. In this ambition he is well sustained by Mr. Roney, who has so far conducted this mammoth plant on a good paying basis.

J. M.

OAKLAND, MD.—The funeral of Henry P. Weber was held at the family residence Monday, July 22. The services were conducted by W. E. Van Amburg, Allegheny, Pa. Many relatives and friends of the deceased were present from other places, also a large gathering of neighbors and local friends. Mr. Weber had lived in this community for twenty-four years and had made a host of friends by his genial manner and business integrity. He was the eldest son of the late Henry Weber, vice-president of H. Weber & Sons Company, and had charge of the farm operations of the concern. He was a devoted husband, a loving father, a kind neighbor and his loss will be keenly felt by all who knew him. He is survived by a widow and five children, his mother, five brothers and five sisters. The interment was on the home farm beside his father.

Circumstantial evidence refutes the report that the deceased committed suicide; the family is now convinced that Mr. Weber's death was entirely accidental. Awakening early in the morning he remarked to his wife that he was feeling better than on the day before and rose to make a fire and attend to the chickens and do the morning chores. His wife, rising a little later, and not finding him on coming down stairs, made search for him and found him lying unconscious across his rifle in the chicken coop. He had purchased a rifle some years previous for the purpose of shooting minks and skunks which were destroying many of his chickens. It is thought that he had heard a disturbance in his chicken coop, and had taken his rifle with him with the thought of possibly shooting the disturber. It would have been impossible for him to have held the weapon in such a manner as to inflict the wound which caused his death. The ball had entered the head somewhat above and back of the left temple and taking a course toward the month, lodging just above the roof of the month, without having held the rifle so close to the head as to have singed his hair or blackened the skin, neither of which was in evidence. Probably the exact cause of his death will never be known definitely, but it is probable that he may have stumbled as there was a step down into the part of the chicken coop where he was found, and having thrown up his hands to protect himself the gun may have been thrown from his hands striking the ceiling above and being discharged causing the wound. At all events, there is no evidence that there was any intention of self destruction.

SANDUSKY, O.—The various parks here are kept in perfect order, but the cut worms are destroying all plantings of geraniums, thousands of which are now almost leafless and flowerless.

White's conservatory is putting up a house, 28x77 feet, in place of two old ones. S.

Heating.

Growers' Problems Solved by U. G. Scollay.

Please advise me what horse-power horizontal firebox steam boiler will be required to heat a greenhouse, 42x200 feet, with 16 rows of pipe, at 45 to 50 degrees in zero weather. Will a 30-horse-power boiler be sufficient or will I require a larger one?

New Jersey.

F. J. F. CO.

—A 20-horse-power firebox steam boiler would heat the house you mention, but if you have the 30-horse-power boiler it will run more economically, and will allow of additions being made at any time. You mention 16 rows of pipe, but do not state the size. If they are 1½-inch you will have sufficient surface. If you mean 1-inch, in my opinion it will be a little shy. If you have not bought the pipe use 1¼-inch instead of 1-inch; you will get better results.

U. G. SCOLLAY.

Kindly advise me whether one 25 horse-power locomotive boiler, steam, would heat two houses, one 150 feet long, 30 feet wide, 15½ feet ridge; one 200 feet long, 30 feet wide, 16 feet ridge. We are to use 2-inch pipe mostly. How would you distribute the pipe? Do you think this boiler would keep up 58 degrees in zero weather?

E. D. C.

Rhode Island.

—The 25-horse-power boiler will not heat the two houses, 150x30 feet each, and the one house 200x30 feet. You will require at least boiler capacity equal to 50-horse-power. You do not mention whether you will use steam or hot water, but state that you will use 2-inch pipe. As many locomotive boilers are used for hot water I cannot very well give you an outlay. It will be impossible for me to give you any suggestions about distributing the pipe until you send a sketch. I have written articles in The Florists' Exchange, complaining about correspondents not sending particulars, for it is not well for me to keep guessing at such problems. State the system of heating you will put in, send rough ground plan of the house, dimensions of elevation, glass, if any, on the sides, mark location of boiler, give grades of ground, etc. All these particulars it is necessary for me to know; and if many of our readers besides yourself would fulfil the conditions made some few months ago, it would help me materially to answer questions promptly.

U. G. SCOLLAY.

I have two connected greenhouses, each 143 feet long, 24 feet wide, outside walls 3 feet high, about 10 feet from floor to ridge. Sash bars are 13 feet long. Please tell me how many runs of 2-inch pipe it will take to heat the houses with hot water in zero weather to about 55 degrees, and for how many feet of radiating surface my boiler must be rated to get the best results from hard coal?

C. F.

New Jersey.

—You will require 14 lines of 2-inch wrought iron pipe to properly heat the house by hot water to 55 degrees inside, zero outside. I would advise a regular rated greenhouse boiler of 5,000 square feet of glass from 55 to 60 degrees in zero weather. It will mean money saved to you to put in a boiler of this capacity.

U. G. SCOLLAY.

CLIFTON SPRINGS, N. Y.—George Raymond, florist, passed away after a week's illness on July 23, 1907. The business is continued by his widow.

Trade Notes.

Business has taken its customary vacation, and but for funeral work and an occasional decorative order, nothing is doing at the stores. Among the growers repairs and planting are in full swing, and apparently every place visited is a hive of industry in this respect.

At the wholesale store, there is nothing of any importance going on, prices for material being exceptionally low, on this account. George Hart has secured the patent on his device for wire pot handle and will put same on market this Fall. J. T. Cokely of Scranton Florist Supply Co. was in town, and reports a fair amount of business doing.

A florists' picnic is in sight.

REMEMBER! FLORISTS, REMEMBER.

That we manufacture Steam and Hot Water Boilers.
That we contract for and erect Heating Apparatus.
That we make a specialty of curing detective apparatus.
That our staff of Heating Engineers is reliable and competent.
That our Mechanics—pipe fitters—boiler makers, etc., are all first-class.

That it will pay you to get our suggestions and estimates.

THE TRADE ONLY—When Writing Please Mention
THE FLORISTS' EXCHANGE.

Our Next Move

is to take that "Burnham" Greenhouse Boiler completely to pieces and then set it up again before your eyes, piece by piece. While we are screwing up the bolts, our "boiler man" here will tell you why each part is made the way it is made.

Through the hot dreamy dog days of August we may let out an occasional yell to wake you up, because this boiler question is one you can't afford to dream over—it will keep you awake next winter if you do.

But all summer long always keep in mind—We make every part for a greenhouse but the glass. We sell any part

HYDRANGEAS

For Summer Blooming.

We have a magnificent lot of Hydrangea Otaksa grown especially for JULY AND AUGUST FLOWERING. The plants are just coming into bloom, just beginning to show color, and will be in perfection during July and August, when they are in great demand at watering places and other summer resorts. There is nothing showier or more satisfactory for lawn decoration. We make a specialty of them, and find an increasing demand for them from year to year. They can be shipped anywhere safely by freight.

Large plants in tubs, \$2.00 to \$3.00 each, according to size; Very large specimens, in half barrels, \$5.00 and \$7.50 each.

GERANIUMS

We have 100,000 in 2-inch pots ready for immediate shipment at prices running from \$2.00 per 100 Standard varieties up to novelties at 50c. each. We will send one thousand in twenty good varieties, our selection, single and double, for \$18.00, or five hundred, twenty-five each of twenty good varieties, for \$9.25.

Below we give some idea of how our varieties and prices run. Our special Geranium catalogue will be sent you for the asking; it has descriptions and prices of 175 and over of different varieties.

DAGATA. Beautiful shade of rose mauve, the Premier of Brunt's 1905 novelties, large semi-double flowers; strong robust grower. 50c. each.

PAMELA. Cannell's 1906 novelty, single large pure white center, followed with shading of rosy lake and bold outer margins of red-dish scarlet. 50c. each.

EUGENE SUE (Lemoine 1905). Single; brilliant orange scarlet; white eye, splendid large trusses, stands the sun well and is an excellent bedder. 20c. each; \$1.50 per doz.

ALLIANCE. 1905 novelties, an Ivy and Zonal hybrid, has the habit of a Zonal and the flower of an Ivy. Lilac white upper petals blotched crimson maroon. \$1.50 per doz.; \$10.00 per 100.

DOUBLE GEN. GRANT. Bright vermilion scarlet. 40c. per doz.; \$2.00 per 100.

LA PILOTE. Semi-double; brilliant scarlet. 40c. per doz.; \$2.00 per 100.

JEAN VIAUD. Semi-double, brilliant rose pink, with white throat, strong robust grower. 40c. per doz.; \$2.00 per 100.

TIFFIN. Single bedder, rich glowing scarlet crimson. 1906 introduction by Lewis Ulrich, Tiffin, Ohio. \$2.00 per doz.; \$10.00 per 100.

BERTHE DE PRESILLY. A beautiful shade of silver rose, double, same habit as S. A. Nutt. 60c. per doz.; \$3.00 per 100.

E. H. TREGO. Dark rich dazzling scarlet; has considerable Ivy blood in its nature which shows in the finish of its flower and foliage. 75c. per doz.; \$4.00 per 100.

PETER HENDERSON. Large semi-double flowers and trusses, bright orange scarlet, splendid habit. 75c. per doz.; \$4.00 per 100.

FLEUVE BLANC. A pure white semi-double of the Brunt type, strong, vigorous, but dwarf grower. \$1.50 per doz.; \$10.00 per 100.

MRS. E. G. HILL. The standard light salmon single. 40c. per doz.; \$2.00 per 100.

S. A. NUTT. More used than any other dark red Geranium, the standard either as a bedder or a pot plant. 40c. per doz.; \$2.00 per 100.

PELAGORNIUM

In Good Variety. \$1.50 per doz.; \$8.00 per 100.

Special Offer of NOVELTIES

To introduce the newer varieties and to give an opportunity to have them thoroughly tested we will for a short time send one each of 50 varieties of the 1905 and 1906 novelties, our selection, for \$5.00 cash. This collection will include those of such noted introducers as Brunt, Lemoine, Rozain-Bouchariat and H. Cannell & Sons and represent one of the finest collections of geranium novelties ever offered in this country.

All stock is in A No. 1 condition and from 2-in. pots, unless otherwise stated.

HARDY ENGLISH IVY

Extra strong, \$2.00 per 100; \$18.00 per 1000.

SWAINSONA ALBA

\$2.00 per 100.

Visitors always welcome. Cash With Order.

BODDINGTON'S CHRISTMAS SWEET PEAS

BODDINGTON'S EXTRA-EARLY CHRISTMAS WHITE SNOWBIRD. An exceptionally early Sweet Pea for indoor flowering—will bloom six weeks after sowing. Color clear white upon long stems; habit fairly dwarf, and of exceptionally free flowering qualities. Trade pkt. 50c., 1/2 lb. \$1, 1 lb. \$1.50, 1 lb. \$2.50.

CANARY. Similar to the above, but flowers of an exceptionally good yellow. Trade pkt. 50 cts., 1/2 lb. \$1, 1 lb. \$1.50, 1 lb. \$2.50.

FLAMINGO. Color scarlet; free-flowering and early. As the crop of this variety was small, we can only send out packets this season for trial. Pkt. 25 cts., 5 packets for \$1.

BODDINGTON'S CHRISTMAS PINK. This is the earliest and most profitable and useful Sweet Pea in cultivation as by sowing the seed under glass in latter part of August, flowers can be cut from Thanksgiving on during the winter months. 1/2 lb. 30 cts., 1 lb. 50 cts., 1 lb. 75 cts.

BODDINGTON'S CHRISTMAS WHITE. A companion to Christmas Pink. Just as free and profuse a bloomer, and is, without doubt, the finest early white for indoor planting. 1/2 lb. 30 cts., 1 lb. 50 cts., 1 lb. 75 cts.

Our Fall Bulb Catalogue now ready, if you have not already secured one—send a postcard today. Besides a full collection of seeds for fall sowing it contains a list of over

Two Hundred Varieties of Perennial Seeds

that can be sown now.

Seed Trade Report.

AMERICAN SEED TRADE ASSOCIATION

George S. Green, Chicago, Ill., president; M. H. Duryea, New York, first vice-president; F. W. Bolgiano, Washington, D. C., second vice-president; C. E. Kendel, Cleveland, O., secretary and treasurer; Leonard H. Vaughan, Chicago, assistant secretary.

PEORIA, ILL.—Frank E. Rue reports the past season's seed business as having been exceptionally good.

CHICAGO.—The Winterson Seed Store are in receipt of calla, Paper White and Roman hyacinth bulbs.

Vaughan's Seed Store have already handled their first carload of Lilium Harrisii bulbs.

W. K. W.

LOUISVILLE, KY.—Wood, Stubbs & Company have secured temporary quarters for the conduct of their business at 208 East Jefferson street, immediately across from their old location, where new stocks are now rapidly being put in, and they are prepared to give their customers' orders prompt and careful attention.

LARAMIE, WYO.—A meeting of the trustees of the Wyoming Plant and Seed Breeding Company was held here July 22. Dr. T. V. Cooke, of Cheyenne, the dry farming expert, is the vice-president of the company the president being Ora Haley and the secretary, Professor B. C. Buffum.

ST. PAUL.—L. I. May & Company are erecting a seed warehouse 120x100 feet, opposite their greenhouses on Como avenue. It is being built of cement and brick—not a piece of wood in it—strictly fireproof, and being on a track cars will be loaded from the building, doing away with all teaming. Complete machinery for the recleaning of all grass seeds will be installed. There will be a large workshop in connection for the construction of all seed boxes, etc. Work has started on the structure and Mr. May expects to have it complete for Fall shipping, which begins about October 1.

PAUL.

WELLINGTON, NEW ZEALAND.—F. Cooper & Sons have purchased a piece of property, with a frontage to Willis street of 27 feet 8 inches by a depth of 111 feet extending down Mercer street. The purchase price was £9,500.

Messrs. Cooper & Sons have decided to erect a modern six story building as soon as the present lessee's time has expired, which will be in about eighteen months. The property is in a very central position, and is regarded by real estate valuers as second to none in Wellington.

The Willis street frontage will be utilized for the firm's Wellington business; the ground floor frontage to Mercer street will be fitted up with several shops for letting. The first and second flats will be sub-divided into offices, etc., while the three top stories will accommodate their wholesale business and head office. It is intended to have a flat roof at the top which will no doubt be attractive to their country and other friends who will be able to go up a lift and enjoy a breath of fresh air. The building will probably be the highest in Wellington between Willis street and the sea front, and will therefore command a magnificent panorama of the harbor.

Prices Advertised in these Columns are for THE TRADE ONLY—When Writing Please Mention THE FLORISTS' EXCHANGE.

CLOVER SEED.—The Crabbs Reynolds Taylor Company of Crawfordsville, Ind., who have been investigating the scarcity of this seed, have issued the following bulletin to farmers:

"Do you know that present reports indicate the shortest clover seed crop for the year 1907 that the world has ever seen? We don't know how reliable these reports may be, but we believe that clover seed will sell at higher prices than usual; therefore, it behooves the farmer to save all the seed he can."

"The clover plants on wheat last Spring has done remarkably well, and the plant in many fields is now above the wheat stubble."

"In 1896 a great many farmers throughout Indiana and Illinois harvested a crop of clover seed off their clover sown in wheat. From our observations, comparing that year and this, we are led to believe that the same thing may be done this year. Seed harvested in this way is not usually of the highest grade, but it paid the farmers well that year to harvest it, and if it has seed in it this year, it will pay again. We advise you to look into this matter carefully."

IMPORTS OF BULBS, SEEDS, ETC.—On July 31, 1907, the following consignments of bulbs arrived in New York per steamer Roma from Marseilles: A. T. Boddington, 51 cases; Henry A. Dreer, Inc., 236 cases; Robert Buist Company, 18 cases; William Elliott & Sons, 40 cases; E. P. Flower, 150 cases; O. G. Hempstead & Company, 37 cases; C. Lustgarten, 39 cases; Lazare & Company, 19 cases; Charles F.

Lee, 52 cases and 33 crates of lily bulbs; T. C. Pollock, 14 cases mushroom spawn; Ralph M. Ward & Company, 9 crates and 6 cases of lily bulbs; J. P. Roosa, 44 packages of flower seeds.

European Notes.

The favorable conditions reported last week continue, and are greatly benefiting our annual crops, peas especially, which we now expect to yield fully two-thirds of a crop. Some of the extra early varieties will probably prove to be a bit weather stained, and pickings of these varieties will possibly prove to be heavy, so that we are chary of making offers at present. Some of the mid-season varieties, such as Prince of Wales and Yorkshire Hero, are doing so well that they will easily be obtained on very favorable terms.

Beans of both the Winsor and the Scarlet Runner classes are doing splendidly; the acreage of the latter is much smaller than last year owing to the destructive frosts in June. As regards the crops grown specially for seed, the low prices paid in 1903-4 have seriously discouraged the growers, and it is impossible to arrange contracts except at an advance of fully 15 per cent. Even at this advance there is practically no profit for the grower.

The usual shortages are apparent in the crops of Golden Self Blanching and White Plume celery; in central France these are practically a failure. The crops of the later and more solid varieties are also wretchedly small both in England and France and higher prices will pre-

The exhibition of the Royal Horticultural Society on July 23 was chiefly remarkable for some splendid exhibits of culinary peas, Carters, Deal, King and Sutton were the principal exhibitors, the former firm staging 250 varieties. This is simply appalling, and if the splendid novelties exhibited by Sutton & Sons are all to be added to the list, it will be necessary to appoint a special committee, as has been done by the Sweet Pea Society, to bring the list within reasonable limits.

While on the subject of sweet peas the following extract from the Globe newspaper for July 22 is enough to make Henry Eckford turn in his grave: "As we have had abundant occasion to remark this year, the sweet pea presents itself in three varieties, each of which has merits of its own. There is the purple sort, the scarlet and the Painted Lady. There are sometimes pure white specimens to be met with." The latter clause may be commended to the notice of Mr. Burpee who has a startling white novelty of the Spencer type which he is booming with his accustomed energy and success.

S. B. Dicks, who has visited America regularly since 1888 for Cooper, Taber & Company, London, is taking a much needed rest this year. His place will be taken by his son, George H. Dicks, who has already visited your side on two occasions, and will start on his third trip per steamer Etruria on August 3. The veteran is having a busy time in connection with sweet peas just now, of which we shall doubtless hear more anon.

vail. The same would be true of soup celery, but for the surplus left over last season.

Visitors to St. Remy de Provence may be interested to know that the "dot" of a daughter of M. Mistral, the son of the famous dealer in chardon (teasel), who was recently married, amounted to 3,000,000 francs. As there are five other children to be similarly provided for it looks as if thistle growing was not such a bad business after all.

Dreer's Convention Month Specials

Cocos Weddeliana

A grand lot of plants in 5 inch pots, elegant graceful specimens, about 24 inches high perfect in every way, something entirely different from what you have been offering to your customers in the decorative line heretofore and a plant which will appeal to everyone, price \$1.00 each, singly or by the hundred. We are also carrying in stock an elegant line of the usual sizes for Fern Dishes in good shape.

2 1/4 inch pots, 5 to 6 inches high, \$1.50 per dozen; \$10.00 per 100; \$90.00 per 1000.

3 inch pots, 8 to 10 inches high, \$2.00 per dozen; \$15.00 per 100; \$140.00 per 1000.

KENTIAS

Although the stock of Kentias generally is scarce not only in this country but also in the Palm centers of Europe, you will find our stock of nearly all sizes very complete, and while some of the medium sizes are not quite as heavy as we have supplied in some seasons past, you will find all of the stock here offered of excellent quality and value.

WE OFFER IN

Kentia Belmoreana

2 1/4 in. pots, 4 leaves, 8 to 10 in. high; per doz., \$1.50; per 100, \$10.00; per 1000, \$90.00.

3 in. pots, 5 leaves, 12 in. high; per doz., \$2.00; per 100, \$15.00; per 1000, \$140.00.

4 in. pots, 5 to 6 leaves, 15 in. high; per doz., \$4.50; per 100, \$35.00.

6 in. pots, 6 leaves, 20 to 24 in. high; \$1.00 each.

6 in. pots, 6 to 7 leaves, 26 to 28 in. high; \$1.50 each.

Araucaria Excelsa—(Norfolk Island Pine)

Our stock of Araucarias is very complete in all sizes; we are especially strong on the smaller sizes which are now so popular. The plants are all of good value, and will be found a profitable investment to grow on for Winter sales.

4 in. pots, 5 to 6 in. high, 2 tiers, 40 cts. each.

5 in. pots, 8 to 10 in. high, 3 tiers, 65 cts. each.

6 in. pots, 12 to 14 in. high, 3 to 4 tiers, 75 cts. each.

6 in. pots, 14 to 16 in. high, 4 tiers, \$1.00 each.

6 in. pots, 16 to 18 in. high, 4 tiers, \$1.25 each.

Araucaria Excelsa Glauca.

5 inch pots, 8 in. high, 2 tiers, 75 cts. each.

6 in. pots, 13 to 15 in. high, 3 tiers, \$1.25 each.

Araucaria Robusta Compacta.

6 inch pots, 8 in. high, 2 tiers, \$1.00 each.

6 in. pots, 10 in. high, 2 to 3 tiers, \$1.25 each.

6 inch pots, 12 in. high, 3 tiers, \$1.50 each.

Fine Ferns

NEPHROLEPIS BOSTONIENSIS.

(The Boston Fern) 6-inch pots, 50 cts. each.

NEPHROLEPIS SCOTTII.

(The Scott Fern) 6-inch pots, 50 cts. each.

NEPHROLEPIS WHITMANI.

The Improved Ostrich Plume Fern.

Unquestionably the most valuable of this type superseding Piersoni, Barrowsi and Elegantissima all of which we have now discarded in favor of this variety. Not only is the pinna on the individual fronds more finely divided, but the fronds are denser, broader and more graceful and the habit of the plant is more perfect.

2 1/4-inch pots, 75 cts. per doz.; \$5.00 per 100; \$40.00 per 1000.

6-inch pots, 75 cts. each.

NEPHROLEPIS AMERPOHLI.

This is the latest addition to the Ostrich Plume type and is certain to prove a welcome and popular variety, holding for delicacy and gracefulness the same position among the Nephrolepis that Adiantum gracillimum does among the Maiden Hair Ferns. The pinna is so finely divided that it reminds one of a piece of fine lace, the fronds are broad and of a depth which gives them a cushion-like appearance. It forms a beautiful specimen and is admired by everyone who sees it. We are now booking orders for September delivery.

50 cts. each; \$3.50 per doz.; \$25.00 per 100; \$200.00 per 1000.

NEPHROLEPIS TODEAOIDES.

Todea or filmy Fern-like Nephrolepis.

This is an English introduction that has received a first class certificate both from the Royal Horticultural Society and from the Royal Botanic Society of London, and is likely to become a most important commercial variety. While in a general way it reminds one of an exceptionally well-grown plant of N. Elegantissima it is entirely distinct from this and all others, in its strong yet compact growth and its bold heavy foliage which is distinctly tripinnate or three times divided. Specimen plants which we now have growing are admired by everyone and we have great faith in its future.

4-inch pots, 50 cts. each; \$5.00 per doz.; \$40.00 per 100.

6-inch pots, \$1.00 each.

NEW DOUBLE BLUE LOBELIA.

Kathleen Mallard.

A charming plant of English introduction, which we are now offering for the first time. It originated as a chance seedling from Lobelia Speciosa and has very large double flowers of an intense rich deep blue color. It is a most desirable plant, which meets with favor with everyone who sees it. We offer good plants for propagating purposes.

20 cts. each; \$2.00 per dozen; \$15.00 per 100.

Begonia Gloire de Lorraine

We are now delivering first class stock of Begonia Lorraine, 2 1/4 inch pot-plants which have been propagated from leaf cuttings and which will make plants that are much superior to stock grown in the ordinary way. You will make no mistake in placing your orders at once; the stock is certain to please you.

\$2.00 per doz.; \$15.00 per 100; \$140.00 per 1000.

For the most complete list of seasonable stock that can be offered at this season of the year see our current Wholesale List. If you have not received a copy it will be mailed to you on application.

OUR EXHIBIT AT THE CONVENTION.

During convention week we will have on exhibition at Horticultural Hall a full line of samples, embracing not only the plants offered above but also many others some of which are certain to prove useful to you in your business and with which you should become acquainted. Our entire staff of travellers will be in attendance and will be pleased to show samples or to pilot you to our nurseries at Riverton, where a personal inspection of our many specialties will prove interesting.

AN INVITATION TO ALL.

Wednesday afternoon, August 21, has been set aside by the entertainment committee of the Philadelphia Florists' Club for a visit to Riverton, and we extend a cordial invitation to everyone to join us on this day. A large steamboat capable of accommodating 3,000 people has been engaged by us for the purpose. The trip up the Delaware River is a most interesting one, and will enable you to gain a good idea of the vast shipping, shipbuilding and many other of Philadelphia's great river-front industries. We will do all that we can to make this day a memorable one in the history of the Philadelphia Convention and we hope that you will be able to join us.

NURSERY DEPARTMENT.

Conducted by Joseph Meehan.

AMERICAN ASSOCIATION OF NURSEYRMEN.
J. W. Hill, Des Moines, Ia., president; C. M. Hobbs, Bridgeport, Ind., vice-president; George C. Seager, Rochester, N. Y., secretary; C. L. Yates, Rochester, N. Y., treasurer.

AMERICAN ASSOCIATION OF PARK SUPER-INTENDENTS.—Secretary-Treasurer Mulford has issued a circular which contains information regarding trains and railroad rates to Toronto for the annual meeting. The one and a third fare has been secured, on the certificate plan. The Queen's Hotel will be headquarters; the business sessions will be held in the City Hall. Short papers on the following subjects are expected: By Theodore Wirth on "Band Concerts in Smaller or District Parks;" by W. J. Zartmann on "Aquatic Gardens;" by John Dunbar on "Some Trees and Shrubs for Park Plantings New or Little Known."

Growing Box-wood for Florists' Use.

There is a growing demand for box-wood for the use of florists, and many engaged in that business as well as some nurserymen have set out small plantations of it to meet the call. There are numerous varieties of box, nearly all of them belonging to the common one, *sempervirens*, the tree box as it is called. There is no better box for florists' use than the common one, generally called *arborescens*, because it is more tree-like than many of its varieties, and nice thrifty shoots are what florists need in all work calling for something green.

The soil most suitable for box is one which is damp and deep, but not wet. It should be deep and well drained, and rich. There is no situation worse for box than a light one, sandy and lacking fertility. With a moist and rich soil the long shoots, full of green leaves, such as florists delight to see, are produced. And with it no leaves are injured by red spider, such as are nearly always to be seen when plants are in a dry situation and in a half starved condition.

When box plants are well established, as they would soon become when in a favorable situation, the cutting away of the young shoots every year for florists' uses would be no disadvantage to the plants, as it would induce fresh growth to start, and would result in shoots of more length than would be made were no cutting back to be done.

Ornamental Trees and Shrubs of August.

The expression that there is nothing in flower among trees and shrubs in Midsummer is one often heard from those invited to look around a place at that season of the year. But those who have such an opinion are greatly mistaken. There are so many herbaceous and bedding plants in bloom in Midsummer that one is apt to overlook the trees and shrubs. This is written just at the close of July, and let me give a list of the trees and shrubs now ornamenting gardens and grounds.

Among the rather rare trees in flower is the *Oxydendron arboreum*, known as *Andromeda arborea*. Its sprays of white flowers are handsome; and when Fall comes its foliage becomes of a scarlet hue. This fine tree is less unknown now than it was; in fact, in many of our parks it is being planted by the hundred.

Dimorphanthus mandshuricus is now showing its large heads of white flowers. To ordinary observers it would pass for *Aralia spinosa*, but it blooms fully a week earlier, and has sturdier shoots.

There are two Fall blooming tamarisks—*Tamarix indica* and *T. japonica plumosa*. These can be grown either as small trees or as bushes. Their slender graceful branches and leaves are pretty all through the season, and when, as now, the twigs are covered with clusters of pinkish white flowers, the charm is doubled. There are a few other species, which flower in Spring.

Viburnum Lantana is another large growing shrub which could be made tree-like if desired. The best way to obtain a tree shape is to cut them to the ground in Spring, and then allow but one strong shoot to grow if more than one makes a start. This *viburnum* is an early Spring bloomer, but it must be admitted to the Midsummer list because of the beautiful red and black berries it then displays.

Another species of *viburnum*, *Sieboldianum*, becomes a tree with but little pruning to make it one. It, too, is now full of clusters of pretty red berries. Its very large leaves have the odor of the greenhouse *lantana*.

Clethra alnifolia is an invaluable shrub for the season. It is now in its prime. It produces long, finger-like spikes of white, sweet-scented flowers. In damp situations, which it prefers, it forms a large, dense shrub.

A companion shrub of the *clethra* in its native wilds, and blooming at the same time, is *Azalea viscosa*. This bears large, white, sweet-scented flowers, and is of quite distinct appearance from *A. nudiflora*, which flowers in May. The blossoms do not all expand at once, but come a few at a time for several weeks. W. F. Bassett, Hammonton, N. J., says there are distinct varieties—one early flowering, the other, late.

Hypericums are not seen in collections nearly as often as they should be. Take the shrubby ones such as *aureum*, *prolificum* and *densiflorum*, and what shrub with yellow flowers is there that could take their places! Then there are the half shrubby ones, represented by *patulum*, *Moserianum*, *calycinum* and *androsæmum*, always full of showy flowers at this season of the year.

The chaste shrub, *Vitex agnus-castus*, is admirable at this season; there are three sorts of it—white, lilac and blue. The *vitex* in common with many other plants in the same order dies back partly in Winter, calling for a good pruning when Spring arrives, which pruning is good for them, ensuring a lot of flowering wood.

fine soil worked in closely about the roots, filling all crevices; and to compact this soil as well as to furnish an abundance of moisture to the roots when the soil is half filled in about the plant, a good soaking of water must be given it, the hole to be filled in entirely when the water has drained away. In ordinary weather treatment as above described would almost ensure the life of the tree transplanted, but let a damp week or so follow the work and success may be deemed assured.

As to pruning, not much need be done when the plants are but a foot or two in height. A little suffices as well, and more when the plants are larger, and it helps toward bushiness, but the fact is, that evergreens do not transpire from their foliage to the same degree as deciduous plants do; and success or non-success depends far more upon the roots being continually moist from the time of digging right on to the end, than on anything else.

With digging and planting properly done and moisture below and above ground for a week after planting, there is no better month than August for transplanting evergreens.

Sambucus canadensis.

A common bush in rather low ground is the elder

Sambucus Canadensis

The flowers of *Buddleia cnrviflora* are pinkish white; those of *intermedia* are darker. Both are borne on long, half drooping spikes. A pretty yellow-flowered one, *globosa*, a favorite in Southern Europe, has not proved hardy here.

Two native *weigelas* (*diervillas*) are in bloom now. One, *sessilifolia*, is native of the North Carolina mountains; the other, *trifida*, of our northern woods. Both have light yellow flowers.

This list could be enlarged, for there is the *Rosa rugosa* to charm us with its flowers and scarlet seed pods, but the list as it is will show that there are a goodly number of trees and shrubs to ornament our grounds with flowers and fruit in August.

August Planting of Evergreens.

The advice to plant evergreens in August is often given by writers and others, and, as a rule, it is good advice, for many a one has had splendid success with transplanting at that time. But there are always conditions which make for success, or loss, in the operation, and the chief one is that of the state of the weather. Evergreens are in good condition in late Summer for moving. The young growth they have made has hardened, while the months of good weather to follow assure the establishing of the transplanted stock, should conditions be favorable. It may be as well to say that there have been failures as well as successes with Autumn plantings.

Ideal conditions would be these: Good loamy soil to grow in; digging of the evergreens with all the roots possible, including a ball of earth if the roots will hold it; the immediate planting of the stock, or, if impossible, then the keeping of the roots moist and free from air until planting can be done. There must be

berry, *Sambucus canadensis*. It has been both praised and condemned by writers. Among those who do not like the shrub are many farmers who have it in abundance in their low ground, and desiring the land for agricultural purposes find the plant has to be exterminated.

Planters have but to consider whether or not it is good for landscape gardening work; and those who know the shrub and its general appearance when in a thrifty condition are unanimous in favor of using it.

Our illustration shows what a clump of it displays. This plant was set two years ago, near a lake, and has been allowed to grow as it would. As will be seen, it makes shoots from below ground as well as above it, but the new ones come close to the base, so that it is not what is considered a suckering shrub.

The shrub was photographed when full of its clusters of purple fruit. At this stage it is deemed more ornamental even than when its white flowers are displayed in Spring.

Wherever used as a single plant it is much admired; and in a situation near water, as the one pictured is, its half drooping growth seems well in keeping with its surroundings, while its fruit when not used otherwise, proves just what birds desire.

Sambucus canadensis is quite distinct from the European *S. nigra*. The latter makes a small tree with a trunk of nearly a foot in diameter at times, while our *canadensis* is always a shrub.

There are two species of elderberry having red fruits, the *Sambucus pubens* and *S. racemosa*. The latter is the stronger grower of the two, though both are shrubs; and both ripen their berries early in Summer.

JOSEPH MEEHAN.

I WILL BE A CANDIDATE IN 1909

EXPERTS say my color and form are equal to that grand old Rose, Baroness Rothschild; my substance and foliage are equal to American Beauty. As a producer, I have no superior among the Hybrid Teas. What more can be said?

YOU had the pleasure of meeting me in my party dress at Washington, D. C., at the AMERICAN ROSE SOCIETY where I was granted a certificate of merit, scoring 81 points. You are now invited, when visiting Philadelphia, to come to my home and see how I behave in my childhood, and how my growth comes on in my early stages.

Truly yours,

CHEERFUL PINK ROSE.

MYERS & SAMTMAN, Chestnut Hill, Philadelphia, Pa.

400—EXPERT ROSE GROWERS—400

(12) Soil.—I have built three houses this Summer—one for carnations and two for lettuce. Last Fall, when I was preparing the soil for the other houses, I had no idea of building, so now I find myself without sufficient soil to fill the houses. I have plenty of last Winter manure. Would it be all right to get loose soil and sand, and mix the manure with these? Or would it be better to use bone meal instead of the manure? Will the soil just prepared give any kind of a crop?
BEGINNER.

New York.
—In this case, the best thing to do would be to get some of the top soil from any land that had been well cultivated, using four parts of soil and one part of the manure, leaving out the sand entirely to fill the benches. If the supply of manure is ample, it will be unnecessary to use bone meal, except as a slight top-dressing after the houses are planted and the plants established.

YORKVILLE GREENHOUSE
Geo. H. Benedict UTICA, N. Y.

1907 is now the twelfth year of our anniversary in a successful career in the importation, growing and shipping of that well-known and much admired evergreen decorative plant, the *Araucaria Excelsa*, *Compacta*, *Robusta* and the *Glanca*. Beginning with the first year (1895) with an importation of 100, this year (Spring 1907) our importation has swollen up to the enormous quantity of 6,000 in the well-known, three best varieties, the *Araucaria Excelsa*, *Compacta*, *Robusta* and the *Glanca*. Our *Araucarias* are so well introduced that at the present time they represent every city, county and state of America, so far as Cuba and Mexico, and from the Atlantic to the Pacific Ocean. It is always my earnest desire to improve my system in buying, raising, selling and shipping our production to such an extent, that it not only benefits ourselves, but so that it will yield a fair profit into the pockets of our buyers. Now is your chance and the time to fill your empty houses and make money fast, as the plants will grow into money while you sleep.

ARAUCARIA Excelsa, 5 in. pots, 10-12 in. high, 3 tiers, 2 years old, 50c. each; larger sizes, 6-6½ and 6 in. pots, 2-3-4 years old, 60c.-75c.-\$1.00 to \$1.25 each.

ARAUCARIA Compacta Robusta, 6 in. pots, 2-3-4 years old, 10-12-16 to 18 inches high, 3 to 4 tiers, \$1.00-\$1.25-\$1.60-\$1.75 to \$2.00 each.

ARAUCARIA Glauca, 3-4-6 tiers, 2-3-4 years old, 10-12-16-18 to 20 in. high, 6 in. pots, \$1.00-\$1.25-\$1.50-\$1.75 to \$2.00 each. Specimen plants, *Compacta Robusta*.

Please state if plants are to be shipped with or without the pots.

Cash with order please.

JERUSALEM CHERRIES or SOLANUM, large berried variety, 2½ in. pots, \$6.00 per 100.

All goods must travel at purchaser's risk.

Shipped with or without the pots.

Plant Notes.

CINERARIAS.—There are some plants which if neglected slightly are capable of recovering from the effects of such neglect or faulty culture, and there are others again that no matter what may be attempting in the way of making up for lost ground will never get over the effects of the ill treatment they were at an early stage subjected to; among the latter plants cinerarias stand out conspicuously. When the time arrives and the seedling cinerarias are in any way crowding one another in the seed pans, they should be immediately potted singly into small pots and then grown on without interruption of any kind. Cinerarias succeed best when grown in shallow frames facing the north; if the frames are so placed that the sun shines on the plants in the middle of the day slight shade, that can be moved at will, may be desirable. These plants will not grow into good specimens if they are kept in a warm temperature; in fact, if they are at all subjected to inordinate heat, they will become drawn and weakly, and the flowers produced by such plants lack substance and endurance. Plenty of air and careful watering are absolutely essential to their successful culture. Whenever the pots are filled with roots the plants require immediate shifting into larger pots. If this is not promptly attended to and the plants are allowed to remain in pots too small for them, there will be no good accomplished by giving them larger pots afterward, because the plants once stunted and forming flower stems will not grow much after that.

Cinerarias dislike a dry atmosphere when growing and for that reason the bed of ashes, upon which it is preferable to place the pots containing the plants, should be kept moderately moist. Whenever there appears any danger of frost, it will be well to move the plants into a greenhouse where they will be safe, always keeping them as cool as safety from frost warrants. The plants should be grown at all stages as near the glass as possible.

PETUNIAS IN FRAMES.—Petunias transplanted very early in Spring into a frame will early in the season produce an abundance of flowers of excellent quality, which come in very handy for cutting at a time when there are not very many things in various colors available. In the hands of the florists petunia flowers of the improved varieties make up beautifully; this year a good many are grown in the manner indicated above for cutting. Petunias grown indoors for Winter blooming are more common now than formerly, and although they do not make into quick sales in some localities, they are nevertheless of considerable merit as pot plants. Petunia seed may be sown now to obtain plants for Winter flowering. They like a moderately cool temperature in all stages of growth.

DIELYTRA SPECTABILIS is not only one of the most charming herbaceous plants for outdoors, but it is also a splendid subject for forcing. Its exceedingly graceful and beautiful rose colored flowers make it one of the best of its kind for cutting in Winter. This plant should not be hurried into bloom, because if it is the flower spikes will be spindly and practically worthless. A good plan adopted when forcing dielytra is to place an inverted pot or some such covering over the crown until it makes a growth ten or twelve inches long, which brings the spikes away up over the foliage. This covering should be gradually removed, so as to fit the plant to the light eventually. It requires plenty of water while it is making its growth.

GLOXINIAS.—After gloxinias are done flowering the soil should be kept damp as long as there is any vitality in the leaves, but when the tops are about all gone and they thus show unmistakable signs of wanting rest, water should be stopped and the plants stored away in a temperature of about 50 degrees, never lower than 45.

TABLE DECORATION OF PINK RAMBLER ROSES.—At a large dinner party given at Sea View, Newport, R. I., by Commodore Gerry last Saturday evening the decorations were of pink Rambler roses exclusively. The table was a very large one; there were four made-up pieces of these flowers, the large one in the center of the table being especially gorgeous and effective as well as graceful and pleasing.

GLOXINIAS FOR TABLE DECORATION.—Gloxinias are used in considerable numbers in Newport for dinner table decoration, and although several growers here have a splendid red variety they seldom make use of it for evening work because of its darkening effect when placed on the table. Only when the room and fixtures are of a very light color is this color a desirable one to use at night. Light colored varieties of gloxinias are, however, very desirable and well adapted for making up into charmingly effective table decorations.

ALLAMANDAS.—There is nothing like the usual demand for allamanda flowers so far this Summer. I know of several places where there are many hundreds of these flowers blooming and fading unnoticed. In former years there was such a rush for these flowers that the one who got them was considered fortunate indeed. It may be that this year buyers are leaving yellow until the finish up of the season.

EUCONYMUS RADICANS has of late been receiving unusual attention because of its adaptability for various purposes, but I am not aware that it has hitherto been given the credit of being well adapted for planting in shady situations. That it is entitled to that credit I know, however, because the other day I came across a large formal bed planted solely with it. This bed was almost completely shaded by the dense foliage of trees. The euonymus looked at home in the bed, and seemingly not content with answering the purpose for which it was intended, it was desirous of extending still further its usefulness in the way of embracing one of the large trees growing close to the edge of the bed, and climbing well up the trunk.

ROSE GRUSS AN TEPLITZ.—If there is any retail florist who grows his own cut flower material without Rose Gruss an Teplitz the reason surely is that he has never seen it in bloom anywhere through the Summer. This is without the least doubt one of the best, if not the best, rose now in cultivation for planting outdoors with the view of cutting from it. It has almost every good quality imaginable to commend it. In color it is a rich crimson scarlet, and although the flowers are not very large they are borne on such robust growths that their decorative effect suffers but little in comparison with much larger varieties. This rose is also as hardy as any variety is known to be; last Winter, when a great many so-called hardy roses were killed outright, this one, as a rule, came out uninjured. It is good for cutting from, and it is also excellent for bedding where a show of bloom is desirable for a great part of the Summer and Fall. D. M.

American Carnation Society.

Varieties Registered.

By W. N. Rudd, Mt. Greenwood, Ill.

DEFIANCE.—Color bright (so called) scarlet; size easily grown two and three-quarters inches; stem long and stiff; habit upright with no superfluous grass, breaking quickly and strong when topped; growth strong and clean with no tendency to disease; foliage medium wide with heavy bloom and good blue color. Origin cross between Estelle on a seedling having Argyle, Mrs. McBurney and Maceo blood; cross made 1902. An early, free and continuous bloomer believed to be a first-class commercial scarlet.

SINCERITY.—Color deep Daybreak shade, hot sun deepens instead of fading color; size easily three inches; stem like that of Enchantress, long and reasonably stiff; habit fairly upright with little superfluous grass; growth strong and clean; foliage medium wide, blue green with medium bloom. Origin cross of 1904, two seedlings running back through many generations to Daybreak and Wm. Scott. An early, free and continuous bloomer which by reason of its color and good shipping qualities should take a place as a standard commercial sort. Can be grown to exhibition standard.

ALBERT M. HERR,
Secretary.

American Rose Society.

It is desirable that a meeting of the members of the American Rose Society and all who are interested in the rose, particularly such as are specially interested in the 1908 meeting in Chicago, be arranged for during the S. A. F. week in Philadelphia.

The Eastern growers will there have an opportunity of meeting many of the Western growers, and can perfect arrangements for the convention and exhibition much more readily than can be done by correspondence. I would strongly urge upon the rose growers present in Philadelphia the importance of arranging to attend this meeting and lending their influence and assistance, moral and material, to make the 1908 meeting by far the best in the history of the society.

Our secretary, Mr. Hammond, will be in attendance at the S. A. F. convention and will arrange for time and place of the rose meeting and announce the same in due course. I regret that I will not be able to be with you, but our vice-president elect, Mr. Breitmeyer, will be present and will preside over the meeting.

ROBERT SIMPSON, President.

Clifton, N. J.

Railroad Rates to S. A. F. Meeting.

Members are advised that the Trunk Line Association, in whose territory Philadelphia, our meeting place, is located, has granted a special rate of one and one-third fare on the certificate plan. This rate has been concurred in by the following associations: New England Passenger Association, Geo. H. Watson, secretary; South Eastern Passenger Association, Joseph Richardson, chairman; Eastern Canadian Passenger Association, G. H. Webster, secretary.

Instructions for Members who Live in Territory of Central Passenger Association.

Members are advised that the Central Passenger Association will not join in the reduced rate of a fare and one-third, for the reason that a number of States have provided by law for a standard rate of two cents per mile, particularly in the territories covered by this association. It has, however, made a special concession to our society in that it will sell a round trip ticket to Philadelphia at the rate of two cents per mile in the territory covered by this association, and at the reduced rate of a fare and one-third through the territory covered by the Eastern Canadian and Trunk Line Associations. This special concession is only for those attending the sessions and not for the general public. These special tickets can be obtained only on card orders secured direct from P. J. Hauswirth, secretary, 232 Michigan avenue, Chicago, Ill. The Central Passenger Association has furnished the secretary with these card orders, and should you reside in the territory covered by the Central Passenger Association and desire to take advantage of this special concession you must obtain from the secretary a card order.

In writing for card orders be sure to give the number required, as each person must have one.

Instructions for Members Living in Territory of Western Passenger Association.

The following letter has been received from Mr. Eben E. MacLeod, chairman of the Western Passenger Association:

Mr. P. J. Hauswirth,
232 Michigan Ave.,
Chicago, Ill.

DEAR SIR:

Referring to your application for reduced fares on account of above named occasion:

We have been requested by the individual lines interested in Western Passenger Association territory to refer you to the revised one-way or Summer tourist fares in effect to Chicago and St. Louis, with the understanding that persons can repurchase from those points and take advantage of the reduced fares authorized therefrom.

In order that you may fully understand the situation, I beg to state that the fares to Chicago, Peoria and St. Louis from a large part of our territory at the time of your meeting will be on the basis of two cents per mile, hence if persons desiring to attend same will purchase tickets to those points and then rebuy at the reduced fares authorized therefrom, they will secure practically the same reduction in the territory of this association as would be accorded by fare and one-third on the basis of the old rates. Summer tourist tickets will be on sale to Chicago and St. Louis, from points west of the Missonri River and east of and including Denver, Colo., and Cheyenne, Wyo., at approximately fare and one-third of the fares in effect February 1, 1907. These fares will no doubt satisfactorily take care of persons desiring to attend your meeting from the territory mentioned.

Respectfully,

EBEN E. MACLEOD,
Chairman.

P. S.—It is suggested that the delegates residing in Western Passenger Association territory be furnished with Central Passenger Association card orders, so as to enable them to take advantage of the reduced fares authorized from Chicago, Peoria and St. Louis.

E. E. M.

The secretary recommends that members living in this territory purchase Summer tourist tickets to Chicago or St. Louis, and then avail themselves of the rates mentioned above as offered by the Central Passenger Association.

Jamestown Exposition Rates.

Members are notified that they can purchase cheap railroad tickets which will permit them to attend the convention at Philadelphia and then visit the Jamestown Exposition at Norfolk, Va., on the route home at very low rates.

Full information can be secured from your local ticket agent.

P. J. HAUSWIRTH,
Secretary.

S. A. F. Convention Bowling Prizes.

MEN'S TEAM PRIZES.—Kasting Cup, Whilldin Cup, Michell Trophy, Silver Cup, third prize.

The Philadelphia Cup for team making highest total score in three games (excluding Philadelphia) to belong to team winning it at this tournament.

Silver cup, to man making high individual game.

Silver cup, to man making high three games.

Silver cup, to man making greatest number of strikes.

Silver cup, to man making greatest number of spares.

To each member of team making high total score, Gillette safety razor.

To each member of team making second high score, gold cuff buttons.

To each member of team making third high score, gold and jade scarf pin.

Individual Championship Medal, to be competed for by the man from each team who makes the highest total score for his team, in the three tournament games, to be bowled for at the close of the team contest.

LADIES' TEAM PRIZES.—First prize, silver cup; second prize, silver cup.

To each lady on winning team, silver chain purse.

To each lady on second team, silver belt buckle.

To lady making the highest total score in two games, silver cup.

To lady making the highest score in one game, silver cup.

Open to teams of ladies, who must be wives or daughters of members of the S. A. F., five ladies to each team, to bowl under the name of the Florists' Club, of which their husband or father is a member.

MEN'S INDIVIDUAL TOURNAMENT. open to all members of S. A. F., except those who bowl on the club teams.—First prize, silver cup; second prize, traveler's clock; third prize, silver and leather flask; fourth prize, sole leather suit case; fifth prize, Waterman fountain pen, gold mounted.

LADIES' INDIVIDUAL TOURNAMENT. open to all wives and daughters of members of S. A. F., including those who bowl on teams.—First prize, solid silver compote; second prize, traveler's clock; third prize, solid silver pocket book; fourth prize, solid silver bon-bon dish; fifth prize, solid silver belt buckle; sixth prize, cut glass water bottle; seventh prize, silver and glass cologne bottle; eighth prize, cut glass fruit bowl; ninth prize, cut glass olive dish; tenth prize, cut glass cruet.

Chicago to Philadelphia.

The Chicago Florists' Club, and the visitors who can join them either at Chicago or on the way, plan to use the following route, Pennsylvania Railroad:

Leave Chicago Sunday, 3:15 p. m.; arrive Philadelphia Monday, 6:10 p. m. The fare, including trip to New York city, is \$26.70 for the round trip. These tickets are good for 30 days. Delegates are entitled to ten days stopover in Philadelphia, after which they must go to New York and have their tickets revised there and certified to by C. A. Thorley, a member of the New York Merchants' Association.

Delegates can then return if they desire via Washington, where they may stop over ten days, making a side trip to Norfolk, or they can return direct to their destination in the West.

NOTE.—Delayed members who cannot take the above train can leave Chicago at 10:05 Monday a. m., via Pan Handle and arrive at Philadelphia 12:17 Tuesday noon. Fare by the Pan Handle is \$2 less than the above, or \$24.70.

For further information address George Asmus, 897 West Madison street, Chicago.

GEORGE ASMUS } Transportation
W. N. RUDD } Committee
Chicago Florists' Club.

THE LONDON MARKET TRADE.—We hear a good many complaints about dull trade, and there may be some cause for it, yet there was never before a larger business done. The fault is, supplies are too plentiful, and even under these conditions I find that the prices for really well finished stock have not gone down much. The abundant supplies of fine carnations still affect the sales of roses, and I have never before seen good quality roses quite so low in price at this season. The pot plants have experienced a better trade, yet with the best Ramblers we are getting too many of them. Philadelphia, from Messrs. T. Rochford & Sons, has been grand. Hiawatha, from several sources, is seen in fine well-flowered specimens, but this rose does not come into the market at present. So much of our best produce now goes direct from the growers to the florists, and it is only by getting round to the best stores that one can form an idea of what is done, unless to go to the growers.

Discussion of S. A. F. Presidential Address.

A new plan is to be put in operation by President Stewart of the S. A. F. whereby it is hoped a free and full discussion may ensue on the points made in his address to the society at the forthcoming Philadelphia convention. Heretofore a committee has been appointed to consider the president's suggestions for the betterment of the organization, recommending the carrying out of those which in the committee's best judgment seemed most desirable and practicable. It sometimes happened that the presidential address did not even receive this consideration, but was passed over entirely, the salient and salutary recommendations it contained, as well as its faults and failings being alike "unwept, unhonored, and unsung." The latter treatment always appeared to us most discourteous; for no man likes, after having done his very best, to have his effort—which perhaps may have cost him weeks of preparation and careful thought—treated in a manner bordering on contempt.

However, President Stewart is this year to prevent as far as he can, such a condition resulting in the case of his address; he is appointing beforehand special committees on the subjects he will deal with in his speech so that all matters brought out by him shall receive full consideration and those entrusted with the task be prepared to talk thereon intelligently and understandingly when the proper time comes.

This, we believe, is the first occasion when prior committees on the president's address have been appointed, although it has been customary to select members in advance to discuss certain essays to be presented to the society. The plan is an excellent one, however, and we doubt not the address will be well worth the attention sought to be bestowed upon it, for certainly no one is in a better position to know the needs of the S. A. F. than its president this year. It should not be inferred from this that President Stewart is egotistical enough to believe that he is capable of excelling his many predecessors in the way of making an address, or that his is more worthy of consideration than those that have gone before. He is simply seeing to it that the time and labor given to this matter by an S. A. F. president should be accorded its full and deserved measure of recognition by those whom the effort put forth is designed to best serve. Further, it is to be hoped that mere discussion of the practicable and beneficial points to be submitted will not be the end of the effort, but that an endeavor will be made to put all such into helpful operation. For it cannot be gainsaid that the S. A. F. records may justly be classed as the graveyard of many hopes, aspirations, and disappointments, so far as recommendations being carried out are concerned.

Annual Convention Numbers

OUR issues for the 17th, 24th and 31st of August will, all of them, be particularly desirable for advertisers who wish to make a special drive on their respective commodities.

The reasons why these three numbers will be especially worth while taking extra space in are:

The issue for August 17 will be replete with information regarding the coming convention of the S. A. F. O. H., and with interesting data, carefully compiled and pictorially presented, about Philadelphia, the city where the convention is to be held.

While many advertisers prefer the issue just preceding the convention and have proved conclusively that that particular number is always prolific of business to them, the two following issues—namely, those of August 24 and 31—will be equally effective in selling goods, as they will contain a full and complete report of the proceedings, together with various interesting illustrations to be gathered during the convention.

These three issues will be read and preserved for future reference by thousands in the trade, and your advertisement in either one or all of them will be sure to sell goods.

We shall take advertisements until 12 o'clock noon on Wednesday of each of the weeks named, but prefer to have "copy" earlier if possible.

If you sell anything that a florist needs, and desire to reach the entire trade of the country, here is your opportunity.

The Florists' Exchange

P. O. Box 1697

Nos. 2 to 8 Duane St., New York City

Obituary

George J. Reuter.

George J. Reuter, 77, a retired florist, and one of the best-known men in central Berkshire, died Saturday night, August 3, 1907, at the family residence on Elm street, Pittsfield, Mass., after a long illness. Mr. Reuter was born in Germany and had lived in Pittsfield over half a century. Until a few years ago, when failing health caused him to dispose of his greenhouses to E. Engelman, Mr. Reuter had personal charge of his business and built up a large trade. Although belonging to no organization and never holding office, he was greatly interested in public affairs. Mrs. Reuter died six years ago. He leaves a family of three sons and four daughters.

John C. Teas.

John C. Teas, the veteran nurseryman of Carthage, Mo., died at his home there on July 29, 1907. He was 80 years of age, and had shown an unusual amount of vitality until the last few months. He became ill during the unfavorable weather of the Spring planting season and had since been ailing. For the last two weeks he was confined to bed, and his death had been anticipated for several days.

Mr. Teas was born in Philadelphia in 1827, of Quaker parentage. He went to Carthage, Mo., in 1867. He had previously been in the nursery business at Richmond, Ind. His technical education was obtained in New York, where he first learned the principles of plant growth and management, after getting a good common school education.

Mr. Teas was looked upon by his relatives as a remarkable man, and it is thought few have done more to make Carthage noted than he. He it was who originated Teas' weeping mulberry, a shrub that has been sold the world over under his name. He also put on the market the white Judas tree.

The deceased leaves a widow, four children and two brothers. One of his sons, Edward, has long been associated with his father in the nursery business. He lives at Joplin, Mo., where he owns market gardens and greenhouses. Another son, Walter, lives at Chattanooga, Tenn.

Mr. Teas was a member of the Friends' church, and every one who knew him in his lifetime remembers him as a consistent follower of that faith. The funeral services were held at the residence Wednesday morning, July 31.

The remains were taken to the Mt. Hope Cemetery near Webb City for interment.

CLUB AND SOCIETY DOINGS.

Society of American Florists and Ornamental Horticulturists.

Department of Registration.

Julius Roehrs Company, Rutherford, N. J., submit for registration:

RAMBLER ROSE, NEWPORT FAIRY.—Fine dark pink, center pale, very free flowering, strong and vigorous grower.

P. J. HAUSWIRTH, Secretary.

LENOX (MASS.) HORTICULTURAL SOCIETY.—The regular meeting of this society was held Saturday, August 3. Owing to the illness of President Herremans, Vice-President Jack occupied the chair. E. Jenkins was awarded a certificate of cultural commendation for an exceedingly well flowered Dendrobium Phalaenopsis Schroderae. It was voted to have a field day; the date to be decided at the next meeting. The annual and perennial exhibition will be held in the Town Hall, Lenox, on Thursday, August 15, and from all accounts will be equal to any given by the society.

G. H. I.

CONVENTION OF AMERICAN CEMETERY SUPERINTENDENTS.—On the same days as the convention of the S. A. F. is held in Philadelphia the American Association of Cemetery Superintendents will hold a convention in Providence, R. I. Providence is a large and prosperous city and will, without doubt, be found to contain much of interest to the visiting cemetery men. The cemeteries of the city will be well worth visiting. Notwithstanding the undoubted city attractions of Providence it is just as well and perhaps better that the committee in charge of the arrangements for the convention decided that one day would be devoted to sightseeing and other forms of enjoyment in Newport. The visitors will be conveyed by boat from Providence to Newport; it is a delightful trip and will, I am sure, be much enjoyed. On landing at Newport the members of the party will be taken in hand by Colonel A. K. McMahon, superintendent of the Island Cemetery, and anyone who knows the colonel will say that means the beginning of a really good time. This good time, as good it certainly will be, will include a drive to Easton's Beach, where the inner man will be strengthened, after which the party will be conveyed in coaches along Bellevue avenue and over the Ocean drive, stopping here and there to visit a few of the more important private estates and other points of interest.

D. M.

THE AMERICAN CARNATION SOCIETY.—A meeting of the board of directors of the American Carnation Society will be held at the Hotel Walton Philadelphia, Pa., Thursday, August 22, immediately after the adjournment of the evening session of the S. A. F. Program and premium list for our meeting in Washington next January will be adopted and all members are invited to meet us. Try and get a few new members from your section. Dues the first year \$3, afterward \$2 per year. Send money and name to the secretary.

Signed, FRED. LEMON, President.

Attest: ALBERT M. HEER, Secretary.

Lancaster, Pa.

The New Greenhouses of F. R. Pierson Company, Scarboro, N. Y.

The two large houses recently erected by F. R. Pierson Company at Scarboro-on-Hudson, N. Y., are of more than ordinary interest to progressive growers. In point of location, a better site could hardly be imagined, as a natural advantage is afforded by the topography of the surrounding estates. Running east and west there is considerable protection from those directions, and a hill on the north side is equally advantageous. The new houses range alongside of the first large house erected on the property, which is of Pierson U-Bar construction. One house is 325 feet long and the other 350 feet. Both are 55 feet 7 inches wide and 23 feet high. The total area of glass surface of the two houses is 50,350 square feet. They were built by the Lord & Burnham Company, and are of iron frame construction, with cast iron posts bedded in concrete. The sectional plan is followed, each section being 8 feet 4 inches, glazed with 16x24 glass. The eaves are 6 feet 6 inches high, and are of angle iron.

In section the houses are three-quarter span, with four lines of ventilating apparatus, two at the ridges and two at the sides. The benching was done by the Pierson Company under Mr. Pierson's direction; and among the little innovations which his experience has taught him are not unimportant is the dropping of the hand wheels controlling the top ventilators to a point no higher than the benches, and in openings provided for them.

The water supply installed provides hose faucets at intervals of 50 feet along the benches, 126 faucets in all. This effects a saving in hose expense without inconvenience, two or three lengths of hose in each house being all that are necessary.

The houses were built expressly for the growing of carnations, and provision in the heating is made for the easy maintenance of a temperature of 55 to 60 degrees at night in zero weather. A hot water system, installed by the Johnston Heating Company of New York, is used in preference to steam, and this system is probably the largest hot water system ever installed for a single plant. Two-inch wrought iron pipe is used, and 25,000 lineal feet were required for the amount of heating surface, viz.: 15,625 square feet. There are 36 lines of 2-inch pipe in each house, arranged in 20 coils. The coils are placed along the sides of the houses, and under the benches, of which there are eight rows in each house; and the arrangement is such as to insure an even temperature in all parts.

The boiler house, or pit, is situated between the two houses, about 150 feet from the east end, and a trench about 4 feet 6 inches wide and 4 feet deep runs across each of the houses at this point. The boiler house is 18 or 20 feet deep from the eaves. It is 35 feet long by 25 feet wide, and the stack end

is used for a coal bin, a retaining wall holding the coal in bulk.

The house is of concrete and stone construction and the work was executed by Mr. Pierson's own men, who have become quite adept from an acquired experience at the establishment. Two boilers are installed, of the locomotive return tubular type, and have a capacity of 12,600 square feet each. They are 7 feet high, 4 feet 6 inches wide, and 14 feet 2 inches long, and have each a grate surface of 20 2-3 square feet. Each boiler contains 59 3-inch tubes, 88 inches long, and 30 3-inch tubes 154 inches long. The boilers are constructed of high-grade boiler iron $\frac{3}{8}$ inch thick, hydraulically riveted, and all flat surfaces are well supported with stay bolts and braces. The grates are of the latest rocking principle pattern, and are conveniently operated by especially designed shaking levers. The boilers were expressly built for this installation.

The flow connection is taken from the top of a boiler at about the middle, and is of 8-inch wrought iron pipe. This pipe runs back and connects to the mains with a tee. The return pipe is of the same size, but, before entering the boiler, branches into two 6-inch pipes, one entering the boiler on either side, so as to facilitate a perfect circulation. The flow and return connections on each end of the boilers are valved with an extra heavy flanged gate valve, and valves are also placed on the mains between the connections to the two boilers, so that one house may be run entirely independent of the other, and also that in the event of an accident to one boiler, or a breakdown, these valves may be opened and one boiler operated to heat both houses. The main pipes through the houses reduce in size as the connections are taken off from 8 inches down to 5 inches, and are supported on 2-inch pipe bearers bedded in the concrete walls of the trench.

The coils under the benches are hung on hangers specially designed to suit the circumstances of the installation. A double hook, with supporting rims, to which is bolted a piece of flat iron $\frac{1}{2}$ inch x 1 inch, is used. This hanger is nailed to the cross trees of the benches. The necessity for a device of this kind, instead of one of the many ordinary hook plates or brick piers, arises from the fact that the bench legs are of locust and very irregular in size, making it almost impossible to screw a hook-plate to them; brick piers were hardly practicable, as the greater part of the ground on which the houses are built is filled in to a depth, in some places, of 5 and 6 feet.

One boiler is fitted with a Holly Castle circulator, which is designed to circulate the water more rapidly when required, as might be the case when there is a sudden and severe drop in temperature.

Both boilers and steam connections are covered with asbestos, lapped with canvas bound with brass, the canvas coated with white lead. Besides preventing radiation of heat, this addition gives a fin-

Diagrams Showing Heating System of New Houses of the F. R. Pierson Company, Scarboro, N. Y.

ished appearance to the boiler room seldom seen in greenhouse establishments.

A new concrete pit building, 25x50 feet, has been recently constructed between the two new houses west of the boiler pit, which is to be used for cool storage for cut flowers.

Results in Growing Cladioli.

(Paper prepared by H. H. Groff, Simcoe, Ont., for Meeting of American Breeders' Association at Columbus, O.)

At Work for Fifteen Years.

As an interested amateur breeder of animated life since boyhood, as well as an enthusiastic horticulturist, the modern knowledge of the similarity of the biology of plants and animals found me with an open and receptive mind—and as appealing more strongly to the imagination than work on animate life, I abandoned the latter, and to the exclusion of almost every other interest, confined my activity to one plant, the gladiolus, with such effect that in over fifteen years I never lost one day during the breeding season. This persistent and continuous activity, with the use of the best material obtainable from all outside sources, is the price of the success that I am able to claim in the interest of civilization and horticultural science. For an unknown man, in an obscure town, in a country of slandered climate, to bring a semi-tropical plant to Canada, as the foundation for a strain of world-wide recognition, seemed the height of folly and a deliberate courting of failure and loss, and it did not take me long to discover that to secure more than partial success meant a severe and persistent fight.

and beauty, that growers thought of allowing large blocks to freeze in the fields with the view of stiffening the market, certainly not a very progressive idea. The advent of my new hybrids changed all this, and the exhibits made at the Pan-American Exposition where they were awarded a gold medal, and at the St. Louis World's Fair where they secured the Grand Prize, not only re-popularized the flower but exercised a favorable reflex influence on existing low-grade stocks. Thus no existing acreage has been displaced, but the values have been improved, with over one hundred acres of the highest quality in the world added to this country, of such excellence as to enforce commercial recognition throughout the civilized world. Surely this may be included in the record of results.

My practice has proven that not only can the scientific worker do all that he may sanely plan to do, but he will find that from year to year mutations will appear beyond the range of the area of his expectations, of such progressive value that he will be led onward by an ever lengthening and boardening horizon—beyond the conception of the human mind.

The past season has afforded an increased number of proofs as to the correctness of the system of breeding advocated by me. I repeatedly collected in the field new varieties of special merit, supposing them to be the same, until compared in detail, when the transmitted parental characteristics of each collection was distinctly traceable but with sufficient variation as to make each variety valuable, each bearing distinctive qualities of value under the diverse cultural conditions to which they inevitably must be subjected.

An Example of Results Obtained.

It is not easy for me to illustrate to you by comparative description the highest points of results

northern part of our peninsula, it is fully a month too short for the full maturing of the cornels of many valuable and useful varieties developed from late maturing material.

Some Scientific Facts.

As I have referred to the fact of scientific results I beg to record.—That crossing from varieties tending to double has induced the production of twin corms from single seeds.

That bud variation, partial the first season and complete the second, has produced a fixed new type, sporting from one of apparent equal fixity.

That atavism of aesthetic and commercial value, results from the intercrossing of advanced types of diverse parental extraction, the flower form of the iris, a plant of the same natural order, having been brought from the ages long past and replacing the normal form of that of the original species.

That racial qualities are as potent and capable of direction in breeding for specific results in plant, as in animal life.

That no simple or limited crossing can produce the value, quality and satisfaction equal to those resulting from unlimited removals from the wild species on the lines of scientific selection, guided by learned human intelligence.

That the attainment of the highest success in results is easily secured by cultivation of the perception, some learning, an open mind, use of the best material, and unlimited work.

Greenhouses Over a Coal Mine.

Your correspondent occasionally runs across some favored member of the trade that for an ideal situation and natural resources leaves almost nothing to be desired. Some have springs of water in their greenhouses and others have the same essential element in

Greenhouses of H. Glenn Fleming, Fairmont, W. Va., Located Over a Coal Mine.

I found the conditions of soil and climate admirable, and the absence of long continued periods of atmospheric humidity most congenial to the work of successful crossing. Although the season for maturing late crosses is unfavorable, I overcame this difficulty in securing the admixture of midseason and late flowering types by cutting the immature seed spikes on the first threatened frost, and maturing in water a month later—a process requiring much time and trouble—but a pollen from young early flowering types (which bloom till frost) was used, I soon had the valued characteristics of the later flowering sections, available for normal use at a more favorable season, a victory over adverse conditions, of incalculable value.

Again I found that our clear dry atmosphere, so favorable to success in crossing—also frequently wilted the flowers—an effect not only making rapid work impossible, but most prejudicial to the "taking" of crosses so made.

This difficulty I overcame by daily carrying the pollen over until the following dawn, when I found that the work could not only be accomplished in far less time, but that the percentage of successful crosses was most materially increased—the two foregoing original practices are the result of a struggle for control, and as I have never heard of them being advised, I may include them in this record of results.

Progress in Breeding Gladiolus.

The time allotted for this address will not permit me to report more than a few of the points that I am sure will be valued by plant breeders.

When I began this work over fifteen years ago, although Europe had been engaged on it for one hundred years, the ground was only broken—varieties lacked vitality, reproductive powers and adaptability to changed conditions, and my first work covered a complete series of violent outcrosses in which every section was made use of to bring the desirable features possessed by each, under control for transmission in cross-breeding. From the foundation work of those first years, by the aid of selected types as sires, according to the practice of animal breeders, has this control been handed down with continuous yearly progression to the past season.

In America the flower was discredited, and the demand so influenced by its lack of quality, value

claimed by me. If you were all gladiolus experts it would be much easier to secure your appreciation. One effective illustration will assist however.

During the earlier years of my experience in securing commercial efficiency the invariable cry was, "send no red shades." In 1905 Mr. Cowee was offered \$5 for a single corm and I was offered \$10 for one of the same variety, a brilliant red, both offers being from amateurs of moderate means, and I may say that no such offer was ever made to me for a variety of any other color. A single spike of six flowers measures one foot wide by two in length, and is so effective as to center attraction in a field of thousands of other varieties. This variety is being rapidly multiplied for early introduction, but you will be interested in learning that I have types of later origin that will supercede it in due time. You will of course expect this additional result.

Supply and Demand.

The commercial demand for high class lights has now been filled by the thousands of new varieties originated by me during the first ten years of my work; selections bred from this material have given me thousands of newer and more advanced types which have been crossed and multiplied during the past five years for future introduction, and will constitute as marked and distinct an advance as did those shown at the Expositions referred to. The value of some of these is beyond estimate.

The present commercial yellow is deficient in color, quality and multiplying qualities. This need will shortly be filled by thousands of new varieties developed by me under the same practice that produced the new light section, all varieties of equal and greater quality than the few novelties issuing from European sources under name.

All other desirable colors are receiving the same attention and improvement by the same system of selected breeding. Among all of these are remarkable types of promise beyond my expectations, individual varieties of such special qualities as to be beyond description for want of adequate comparison—sufficient to ensure your comprehension and appreciation of these results.

I have referred to our geographical advantages, but these are by no means sufficient for my personal realization of the best commercial results. Although my season is nearly a month longer than even the

large quantities on their land. Again we find many that are able to connect with a supply of natural gas for fuel, thus giving them the satisfaction of laughing at the collectors of both water tax and coal accounts.

The situation of H. Glenn Fleming, of Fairmont, W. Va., is one having a location with the most favored natural resources.

About six years ago Mr. Fleming erected several substantial greenhouses on Locust avenue. One of the indispensable adjuncts of a greenhouse establishment is a boiler pit or stoke hole. The proper location was mapped out for the boiler room and the work of excavation begun. The digging had not proceeded very far before a fine bed of soft coal was struck. This bed extends under the entire greenhouse establishment and looks as if there may be enough coal there to run the greenhouses for generations to come.

Although coal has been used from this mine for the past six years, only a comparatively small excavation has been made. When first completed the coal could be shoveled from its natural stratas into the boiler. It is necessary now to have a small track and a diminutive car to run the coal from the bed to the furnace door. The night fireman mines the coal as it is required for the greenhouses as well as the other requirements of Mr. Fleming's household. This Mr. Fleming prefers to do, as by mining in quantities would necessitate a place for storage and an expense of second handling. He prefers to let the fuel lie in its natural stratas and mine it as required and in such quantities as desired. Mr. Fleming is therefore mine owner, operator, and florist combined, a combination of which hundreds of his fellow craftsmen may justly envy him.

The mine is used during the Summer months as a cold storage room. Cut flowers keep well there, and for starting hyacinths and bulbous stock in Fall it is unequalled.

Mr. Fleming is the only florist in Fairmont that has any glass and has a good trade, growing roses, carnations and bedding plants as well as carrying a nice stock of decorative plants for the general requirements of his patrons.

J. M.

DIRECTORY OF RELIABLE RETAIL HOUSES

The retail florist firms advertising under this heading will accept and fill orders for flowers and floral designs forwarded them by mail, telegraph or telephone, the usual commission of 25 per cent. being allowed.

\$25.00, payable quarterly in advance, will entitle the advertiser to a four-line card, under this heading, for one year, 52 insertions. For every line additional to four, \$5.00 will be charged. Four lines will average 32 words; each additional line, 9 words. Each advertiser receives one copy, free, of our Florists' Telegraph Code.

New York.

YOUNG & NUGENT, 42 West 28th St. We are in the theatre district and also have exceptional facilities for delivering flowers on outgoing steamers. Wire us your orders; they will receive prompt and careful attention.

MYER, 611 Madison Ave. My facilities for delivering flowers for any and all occasions are unexcelled. Can give prompt service to steamer and theatre trade. Telegraphic orders solicited. Telephone, 5297 Plaza.

Kansas City, Mo.

SAMUEL MURRAY, 1017 Broadway. I will deliver orders for flowers in Kansas City and vicinity promptly. A first-class stock of seasonable varieties of flowers always on hand. Wire me your orders.

Washington, D. C.

GUDE BROS., 1214 F Street, N. W. We excel in high-class flowers and design work of every description; quick service, reasonable charges and liberal treatment have placed us on top. Try us.

Milwaukee, Wis.

THE C. C. FOLLWORTH CO., Wholesale Florists, will take care of all your Retail orders for the delivery of flowers anywhere in Wisconsin.

Detroit, Mich.

JOHN BREITMEYER'S SONS, Broadway and Gratiot Avenue. We cover all Michigan points and large sections of Ohio, Indiana and Canada. Retail orders placed with us will receive careful attention.

Denver, Colo.

THE FAKE FLORAL CO., 1706 Broadway, J. A. Valentine, Pres. Orders by wire or mail carefully filled; usual discounts allowed. Colorado, Utah, Western Nebraska and Wyoming points reached by express.

Cincinnati, O.

HARDESTY & CO., 150 East Fourth, sell the best grade of flowers grown. Retail orders from distant points for delivery in Cincinnati or surrounding territory will receive prompt attention. Telegraph us.

Dayton, O.

W. G. MATTHEWS, FLORIST, 16 West Third Street. Flowers in any arrangement for all occasions for Dayton and vicinity. Personal attention given to all orders. Long distance telephones.

Dallas, Texas.

LANG, THE FLOEIST, the largest flower store in the South. Floral designs and all flowers in season; personal supervision and prompt service in Oklahoma, Texas, Louisiana. Mail and telegraphic orders solicited.

Louisville, Ky.

JACOB SCHULZ, 644 4th Avenue. Personal attention given to out-of-town orders for Louisville and surrounding territory. Have a choice line of seasonable flowers always in stock; delivery facilities perfect.

Indianapolis, Ind.

BEETERMANN BROS. CO. Our facilities for executing orders in an efficient manner are unexcelled. Our shipping territory includes the surrounding states. High grade flowers; expert workmanship.

Albany, N. Y.

EYRES, 11 North Pearl Street, cut flowers or floral designs delivered to any part of Albany and vicinity on telegraphic order. Personal attention given and satisfaction guaranteed.

Chicago, Ill.

HAUSWIRTH, The Auditorium Florist, 232 Michigan Avenue. The quality of our work is of National repute, and we are prepared to execute commissions in first-class style in Chicago and its environs.

Retailers desiring a share of out of town trade should be represented by a card in this column.

FOR THE RETAILER

For reproduction on this page, we solicit from our readers engaged in the Retail Trade, good, clear photographs of subjects that are of general interest, such as store interiors, designs of different classes, new delivery wagons, etc.

A Real Roof Garden.

Many of the so-called roof gardens in New York city are gardens in name only; several of them are entirely enclosed by a glass roof, and the garden could only be designated as such by one having a most elastic imagination. Most of these gardens consist of a few tubs of California privet or a dilapidated hedge of the same material; possibly a few skeleton bay trees are scattered here and there struggling for bare existence—and that is all. There are others that are still worse, where artificial plants are employed, but they require no description here; you have all seen them.

A real roof garden, however, really exists in hot, dried-up New York city, and every native and every visitor should see it. It is located at the Hotel Astor. The whole house is a decided credit to both the management and the florist who carried out the work. Around the front of the hotel, between the several entrances, are placed large Kaiserkrone bay trees; they stand about twelve feet high and are, properly speaking, standard

are here arranged to form a maze. The inner roof of the cupola is entirely hidden by a bank of red geraniums in full flower. This effect is obtained by placing a series of long boxes, such as are used for windows, one above the other on wooden steps, made to hold them. They can be viewed equally well from below or above. At either end of the sloping roof of the cupola a rock garden has been constructed, with a pool and fountain at the base. Water flows down over the rocks in miniature cascades. Boston ferns, rex begonias and a variety of other things are planted among the rocks. The Cooper-Hewitt lights are employed for illuminating this arrangement; they are artfully hidden behind the rocks and ferns, and give the impression of pale moonlight. Every detail has been carefully thought out with surprisingly good results. A card from the office entitles one to ascend to the roof, and certainly is a privilege that should not be missed.

D. RAYBUN.

Appraisers' Decisions.

DRIED SEA MOSS.—Protest of A. Herrmann against the assessment of duty by the collector of customs at the port of New York. Before Board 1, July 24, 1907. Opinion by Lunt, G. A.

Sea moss, dyed and prepared, was held dutiable as sea moss under paragraph 81, tariff act of 1897, as claimed by the importer.

MOSS WREATHS.—Protests of A. Herrmann et al. against the assessment of duty by the collector of customs at the port of New York. Before Board 1, July 24, 1907. Opinion by Lunt, G. A.

Wreaths and crosses composed of natural rock moss, dyed and prepared, and being suitable and used for decorative purposes, which were classified as unenumerated articles under section 6, were claimed to be dutiable as sea moss under paragraph 81. Assessment affirmed on the authority of Abstract 7775 (T. D. 26655).

WHITE HEATHER BLOOMS.—We have received from James Smith & Sons of Darley Dale Nurseries, near Matlock, Derbyshire, England, a sample consignment of flowers of the white heather. The package came by parcels post, and the blooms arrived in good condition, the sprays being well covered with the beautiful white bells.

This firm makes a specialty of growing heathers, and holds a stock of about one million plants, being possibly the largest growers of these in the world. The flowers of the white heather are very fashionable in England and elsewhere abroad at all weddings and social functions, and large quantities are supplied by this firm for these purposes during August, September and October. This year the concern desires to cater to the Canadian and American trade; and as there is no blossom with which so much sentiment is associated, none which appeals so strongly to all, no matter of what nationality, who love flowers as the "bonnie, blooming heather," doubtless the enterprise of Messrs. Smith & Sons will meet with the success it deserves. The season of Scottish games in the larger cities of America is close at hand, and a supply of heather for these occasions would doubtless be readily disposed of.

"Send a bit of heather o'er the sea;
Simple offering though it be,
Prized 'twill be where fairest flowers
Blossom in their tropic bowers,
Or where leebegs frowning towers
O'er the sea."

Stock, Sutton's Giant White. Ten Week

Photo by John F. Johnston.

pyramids. The front is further decorated by large window boxes filled with a variety of foliage plants, aucubas, dracanas, Boston ferns, etc. Palms and ferns are placed about the hotel in artistic profusion. A pretty fountain effect greets the eye at the main entrance; the basin is surrounded with an arrangement of mixed ferns; gold fish and aquatic plants are in the water. A similar fountain occupies the center of the ladies' reception room. All the plants in the hotel are in perfect condition and bear evidence of good care.

But the crowning feature is the roof garden which is a veritable fairyland after dark. Rows of electric lights are hung above the outer edge of the roof, and are visible from the street below. The garden proper occupies three sides of a hollow square. A pergola arrangement runs around its whole length; this is lightly covered with growing vines—wistarias, ampe-lopis, etc. Here and there a basket of growing plants is suspended from the pergola above. Tall hedges of California privet cover all unsightly places, but they are merely used as a screen not as an adornment. Large urns filled with hydrangeas greet the eye at every turn, the dwarf variety being used to great advantage in the taller urns. The masses of bright pink flowers attract immediate notice. Half barrels painted green and filled with the tall growing Rudbeckia Golden Glow in full flower form a unique feature and look surprisingly well. The cupola, which extends along the whole front of the building, is most conveniently placed; it rises about fourteen feet above the main roof, and its flat top is reached by flights of steps. Hedges of privet

NEW JERSEY FLORICULTURAL SOCIETY.—At the Midsummer monthly meeting of this society held on August 2, only twelve members put in appearance and two visitors. The horticultural display was varied and included flowers, fruits, and vegetables. Julius Roehrs Company, Rutherford, N. J., showed Phalenopsis Rein-stadtiana, Cypripedium Mandia and Dendrobium Phalaenopsis Schroderae. Joseph A. Manda of West Orange, exhibited a new ecogyne and Cypripedium Sandera-Curtissii; awarded a first class certificate. John Crosby Brown (gardener Peter Duff), had peaches Princess of Wales and Thomas Rivers; Sydney and Austin Colgate (gardener William Reid); grapes Museat of Alexandria and Black Hamburg; Stewart Hartshorne (gardener Arthur T. Caparn), zinnias and a collection of vegetables; Charles Hathaway (gardener Max Schneider), salpiglossis and the new strain of Sweet William, "Amwell;" Stewart Dickson (gardener Albert F. Larson), Cypripedium Harrisonia and Lycaste aromatica, also a well arranged display of rudbeckia.

The judges for the evening were Joseph A. Manda, Arthur T. Caparn and Edwin Thomas.

It was announced that the sum pledged as a guarantee fund for the Fall show has reached \$265, making the exhibition an assured fact. Mr. McTaggart of Thorburn's in the name of his firm offered \$10 as a prize for vegetables.

The schedule for dahlia night at the October meeting was read. Charles Schweinfurth, formerly with Paul Wilcox of Montclair and now gardener for Mr. McNaughton, proprietor of the Lister estate, was a visitor.

Society of American Florists

YOU ARE INVITED to visit us during Convention week, any day at your convenience.

ANDORRA presents a unique Nursery—six hundred acres of hilly land, containing over three hundred and fifty acres of **Ornamental Trees, Shrubs, Vines and Perennials.** Our **Location** permits us to grow many varieties both in deciduous and evergreen trees and shrubs that cannot be grown to advantage North or South of this latitude, and thus adds to our extensive collection many desirable and decorative plants.

ANDORRA has been called **The Modern Landscape Nursery.** The lay-out of our land, with its hills, valleys and woodland, permits the planting of trees and shrubs in natural positions, thus affording planting suggestions at every turn.

ANDORRA is easily and quickly reached from the Convention (Horticultural) Hall by the Pennsylvania Railroad from Broad St. Station (at Broad and Market Sts.) to Chestnut Hill Station; then by trolley, which passes the depot, to the City Line. Our office is one block from the trolley terminus at City Line.

REMEMBER, this is a personal invitation to **YOU.**

A Few Penna. R. R. Trains.

Being the largest growers of assorted Hardy Heaths in the British Isles (having upwards of half a million salable plants in stock), we are enabled to give clients better value than they can possibly obtain elsewhere.

NOTE.—Orders unaccompanied by cash will not be recognized.

James Smith & Sons

Darley Dale Nurseries. Near Matlock, Derbyshire, ENGLAND

William Robertson.

Winner of W. P. Craig Prize for best grown three plants of *Nephrolepis Amerpohli*.

test to grow on three plants of this fern, for the August meeting of the club, Wm. P. Craig to loan them the plants, each exhibitor to select his three plants by lot. Nine men entered the contest. As reported in a previous issue the prizes were first, \$10 and one plant exhibited by winner; second, \$7.50; third, \$5. Wm. Robertson, gardener to Mr. John W. Pepper was first; Wm. Kleinheinz, gardener to Mr. P. A. B. Wid-

ener, second; Thomas Long, gardener to Mr. George W. Childs-Drexel, third. The judges were Edwin Lonsdale, James T. Clark (H. A. Dreer, Inc.), Wm. H. Taplin, and Geo. Redles. Former Mayor Wm. B. Smith distributed the prizes, and the remainder of the evening was spent in listening to songs, recitations, etc., by H. T. Dumont, A. M. Campbell, Edward Dooner, J. O'Donnell and Wm. Wunder, and in partaking of the sumptuous repast provided by William P. Craig. All spent an enjoyable evening.

The result of the fern contest was a surprise to many, as Thomas Long, known as the king of fern growers, was thought sure to carry off first prize; but this time he had evidently been too kind to his plants and overfed or forced them too much, as they were tender and lacked fullness in the center, so that smaller and more perfect plants took the prize. Some of the plants exhibited will be seen at the convention.

S. A. F. Matters.

Now as to S. A. F. matters: Additional exhibitors at the trade exhibition are Wm. H. Moon Company, Herendeen Manufacturing Company, W. A. Manda, Lager & Hurrell, Godfrey Aschmann, Milton Adler, Philadelphia Flag Company, Dayton Paper Novelty Company, Anders Rasmussen, Benjamin Hammond and Jas. G. Neidinger.

What with the printer and the operator of the typesetting machine, things are getting mixed up, and Job, John Birnie and a few more may think we have some special brew on tap; anyhow, last week in my notes, it read, that at the Olympia bowling alleys, where the ladies' bowling and men's individual games were to take place, there were two alleys. Twelve alleys is correct. This city might have done things once that way, but now we are second to none.

Then in the official report of the S. A. F. it says the ladies are to be taken on a trip on Friday; the ladies' trip to Willow Grove is on Thursday.

By the way, who wants a game of quoits? We have a member of our club who offers to play all comers, so if anyone cares to take him up, send word and we will get together the necessary appliances, including the referee with his rule.

We are sorry to report that Edward, second son of Joseph Heacock, is probably lost in the Columbia River, B. C. He was in British Columbia traveling with a companion. Going down the river in a canoe, the canoe turned turtle; his companion swam ashore, and Edward Heacock was last seen hanging on to the canoe. We hope he has landed somewhere down the river, but in the meantime the suspense is very trying to his parents and relatives.

DAVID RUST.

Prices Advertised in these Columns are for THE TRADE ONLY—

THE FLORISTS' EXCHANGE.
When Writing Please Mention

400,000 More Calla Ethiopica Bulbs

Over 472,000 shipped to old and new customers. All orders from now on will be shipped next day order is received. A good many florists are ordering **Bulbs** to plant after chrysanthemums are pulled out. I prepay freight when cash comes with order. Notes on the Garden Lilies.

There are no better or more showy flowers for the hardy border than many of the species of lilies; indeed the list is so large and varied that there may be some in bloom almost every day throughout the season. I do not propose at this time to go into species that may be rare and will grow only with uncertain success, but will briefly mention some of the better showy species for brightening up the hardy garden throughout the season.

During the month of August there are fewer species of herbaceous plants in bloom than in the earlier part of the season, but if lilies are planted freely they will not only brighten up the garden but will prove very useful for cutting and decorative purposes.

Lilies like a rich, deep soil; indeed, with the exception of a few varieties, there is little danger of a lily bulb being planted too deep. I believe there are more failures in growing lilies out of doors from shallow planting than from any other cause.

Lilies of such types as speciosum or auratum should never be planted less than twelve inches deep, while the depth of planting others depends somewhat on the habit of growth. In any case, it is better to have the soil trenched to a depth of at least two feet. A friend of mine, who has been a great traveler in almost all parts of the globe, tells me that in Japan, where the *Lilium aratum* is found growing wild, more bulbs are found at a depth of two feet than nearer the surface; and, indeed, if you will go into the fields and try to dig up the bulbs of our native *L. canadense* or *superbum*, you will always find them deep in the soil.

One of the earliest lilies to bloom during the Summer is the Siberian coral lily or, botanically, *Lilium tenuifolium*. It is not a large lily, growing only to a foot or a foot and half high, but it is of a beautiful scarlet color, and when planted in masses is very fine indeed.

Lilium elegans and its many varieties

bloom during the early half of Summer; they are of strong upright growth and are very fine. Some of the best types of this lily are *Incomparable*, *Alice Wilson*, *Van Houtte* and *atrosanguineum*. *Lilium Batemani* is one of the best varieties of this species; it grows about two feet high and is of a beautiful shade of salmon red.

Lilium Wallacei is a very dwarf growing variety which if massed is very effective.

A beautiful lily, blooming about Midsummer, is *L. excelsum*. The plant grows to a height of about three feet and the flowers, which are in nodding heads, are of a creamy yellow shade.

Another good lily in flower about the same time is *L. Brownii*; this has a rather large trumpet shaped flower white inside but marked with purple on the outside. It is a good lily and is worthy of a place in every collection.

Lilium Kramerii, which is said to be a garden variety of *L. japonicum*, is a very fine lily. The flowers are of a rosy pink shade, borne on slender stems and attaining a height of about three feet.

The Turk's cap, or *martagon* lily, is worthy of more liberal planting than it generally gets, for many of the shades of color are good.

At the present time two very fine native lilies are in their full glory. I refer to *L. canadense* and *L. superbum*. I consider the latter one of the finest lilies. The flowers, which are borne in heads of from ten to twenty, are of a bright reddish orange color, many of them very prettily spotted. This lily and also the former will be found very useful to plant in rhododendron or azalea beds, their beautiful flowers showing in fine harmony above the green foliage of these shrubs.

One of the most recently introduced lilies and one of the most valuable garden species is *L. Henryi*. The flowers are of a reddish yellow color marked with brown spots. It is a beautiful lily, growing much after the habit of *L. tigrinum* though not so strong. Speaking of *tigrinum* puts me in mind that

though one of the most common yet this is one of the best of garden lilies, especially if the variety *splendens* is grown; then there is a double form which was always a great favorite with the writer.

Lilium candidum, which is one of the earlier flowering lilies and yet one of the finest of white ones, is a variety that does not need deep planting. Large clumps of this lily are very fine in the border; and then it is so useful for cutting.

Lilium speciosum is so well known as a garden lily that it needs little mention. There are many forms of this lily, some of the varieties being known as *roseum*, *rubrum*, and *album*. The best variety, in my opinion, is *mel-nificum*.

Lilium longiflorum is seldom used as a garden subject, still it is good. *Lilium philippinense* is a slender growing sort, with a very long trumpet, the flower being of the purest white. I have not seen it tried sufficiently as a garden lily, but if hardy enough, and I have been told it is, it should find a place in every collection.

Lilium auratum has been found difficult to manage in this country. I believe mainly on account of shallow planting, as already mentioned. This is the most gorgeous of all the lilies and if well established will do well and throw flower heads which are truly magnificent.

There are many other species which some growers like; for instance, a friend of mine has in his garden a few bulbs of *Lilium giganteum* which thrives well with him, and this season had some splendid spikes of bloom.

Boston, JOHN W. DUNCAN.

FOR SALE—Large hot water boiler, heating capacity 11,000 square feet of glass. Can be seen set up, will sell for one-third actual cost. Address Nason & Sons, Murray Hill, N. Y.

FOR SALE—Greenhouse material and hot bed sash, milled from Gilt Cypress, to any detail furnished. Oxford putty, specially made for greenhouses and hot bed sash. V. E. Reich, 1429 Metropolitan Avenue, Brooklyn, N. Y.

FOR SALE—Half price, 10,000 galvanized carnation supports, Parker's pattern, 2x3 rings almost as good as new, \$12.00 per 1000, set up and delivered at greenhouse. If taken apart and packed, \$2.00 per 1000 added. Thorne & Company, Flushing, L. I. N. Y.

FOR SALE—Two large Refrigerators: one 7 ft. high, 4 ft. 6 in. wide, 36 in. deep, mirrors in front; one 8 ft. high, ft. 10 in. wide, 30 in. deep, sides and front mirrors and plate glass. All woodwork on both white enamel. \$50.00 each. Crating at cost. Idlewild Greenhouses, 89 South Main St., Memphis, Tenn.

FOR SALE—One Bundy tubular hot water boiler, 6 sections, almost new. This boiler is one of the best hot water boilers and will heat 6000 running feet of 2 inch pipe for Violet houses. Price \$100.00. Also 4000 feet of 2-inch pipe with all fittings, as good as new 7½c. per foot. 600 hot-bed sash, in first class condition, 3 by 6 ft. \$1.00 each, for cash only. Address, H. Lehmann, 5th Ave., New Rochelle, N. Y.

SOUND, second-hand pipe with new threads and couplings. 2000 feet, 3 in. outside diameter pipe, 8c. per foot; 500 feet regular 4 in., 15c. per foot; 3½ in., 15c. per foot; 2½ in., 9c. per foot; 6000 feet, 2 in., extra heavy, not threaded, 8c. per foot; 10,000 feet, new, ¾ in., not welded, for fences, supports, etc. We make concrete fire-proof columns. Prices mailed on application. Pfaff & Kendall, Foundry street, Newark, N. J.

FOR SALE—On account of my health, I am compelled to offer my greenhouse specialty business, which includes the Standard Duplex Cutter, which is fast coming into use by the growers. This season many thousands of feet were erected, and at present am shipping a large range to California, also the Standard Steam Trap and the Ventilating Machine. My business is thoroughly established; none better; and is doing a large business all through the season. Address, E. Hippard, Youngstown, O.

SAVE GREENHOUSE FUEL

WITH the Ideal Concrete Block Machine, any florist can build his own greenhouses at little cost. Saves in fuel, because the hollow block is practically frost-proof. Lowers insurance rates and ends the cost of maintenance, because Ideal Blocks are fire-proof and everlasting.

IDEAL Concrete Machine

The original and only perfected Concrete Block Machine working on the face-down principle.

ENABLES the manufacture of Ideal Concrete Blocks from sand, gravel and a little cement at a cost far lower than that of other building materials. May be operated by any man without previous experience. Low in cost, rapid in operation, and can never wear out or break in use.

WRITE for catalogue and illustrations of Ideal Concrete Block construction, of practical value to every florist. Sent Free.

CARNATIONS. Field-grown plants ready next week.

R. G. Hanford, Norwalk, Conn.

REVIEW OF THE MARKET

NEW YORK.—The cut flower trade is rather quiet—not an unusual thing for August, as this is always the duller month of the year. New crops of tea roses are coming in in quantities, and as they are, in the main, extremely short stemmed, their value is low in proportion; 25c. per hundred will purchase a great many of them. American Beauty are more plentiful than any other variety, and while an occasional small lot of the specials bring a fair price, it is always possible to buy in quantity at a figure not exceeding \$15 per hundred.

Carnations are almost out of the race for the time being; few are coming in, but owing to the arrivals of asters there is no demand for them. Gladioli are all too plentiful for fancy prices to be obtained; the variety America is about the only sort that is fetching over a dollar a hundred; good spikes of other kinds can be had at anywhere from 40c. to 75c. per hundred, held over stock being offered as low as \$2 a thousand. Asters have not reached their best yet by any means, still there is a good supply of fair-sized flowers.

Lilies are quite plentiful and they can be purchased at prices that seem too low to be profitable to the grower. Lily of the valley is meeting with a very poor demand, which is rather unfortunate, as there is a good supply just now.

Orchids are represented chiefly by Cattleya Gaskelliana, and while they are not what may be termed numerous, there are more than enough to meet all calls. Sweet peas are plentiful and sell slowly. The first installments of dahlias have reached the market, and while the number is limited they embrace both the eactus and show types.

CHICAGO.—August opened with conditions about normal, there being as usual but a limited supply of good flowers coming into the market and those finding a good sale at Summer prices. The supply of American Beauty roses has hardly been up to requirements; the few growers who make a specialty of Summer Beauty not cutting enough some days to go around. Good white roses have also been supplied in insufficient numbers. The few good carnations that arrive soon disappear, with a call for more; but as asters are becoming more abundant and better in quality they fill in very satisfactorily. Asters are quite plentiful though not enough so to be suggestive of a glut. Gladioli, several varieties of lilies and lily of the valley are in ample supply. Peonies from cold storage are about exhausted. W. K. W.

ST. LOUIS.—The market is in such a poor condition that the least said about it the better. We have good demand for roses and carnations, but the consignments are small and the stock poor. Asters are about the only flowers coming in in quantities. Some are really fine, but the bulk of the stock is short stemmed and off color. The best sellers are purple and white. Other outdoor stock is poor, except hardy hydrangeas, which have some call.

The delightful cool spell the past week put some life into us and most of the retailers are fixing up their stores for the early Fall trade which generally comes with the opening of the schools the first week in September. The growers, too, are busy replanting, building and painting. Prices on stock remain as mentioned in last market report.

ST. PATRICK.

BOSTON.—Business in this city has been dull during the past week which has been known generally as Old Home Week; and although it had been hoped that trade would be increased such was not the case. Asters, which are now one of the principal staples, are more plentiful than they have been, and sell fairly well at \$1 per 100. Roses remain practically about the same except that the flowers may be smaller than a week ago. Carnations, too, are of poor quality, selling at from 50c. to \$1.50. Gladioli are plentiful; there is not a heavy demand for these flowers. There are few lilies. Sweet peas are plentiful and sell very cheap. J. W. D.

CINCINNATI.—Business might be worse. Quite a number of asters are coming in, and sell at \$1 to \$1.50 per 100. Gladioli are not moving as fast as one would wish; \$1 to \$2 per 100 is realized for the poorer grades, while fanciers run higher. Smilax sells at 10c. to 12½c. Good Bride and Bridesmaid roses realize 2c., 3c. and 4c., specials, 5c. E. G. G.

INDIANAPOLIS, IND.—Orders have been filled more satisfactorily since the arrival of cool weather, as stock is much improved. Funeral work is still plentiful with the several retailers. Regular counter trade, too, is bearing up remarkably well, so that much of the choice stock finds buyers early in the day.

The store men do not find the Summer season such a dull one after all, for vacations are in order everywhere and numerous preparations for the Fall season are on hand.

Garden flowers are much benefited by the regular rains. This is verified by the excellent displays seen in the shop windows. Gladioli, hundreds of them, in many shades, are very attractive, at \$1.50 to \$2 per hundred. Golden Glow, too, is of excellent quality at \$3 per hundred sprays. Regular shipments of dahlias are received at \$1 to \$1.50 a hundred. Asters have an excellent claim to their glory as uniformly fine grades are received at \$1 to \$1.50 a hundred. Tuberoses are nice for flower work, at \$1 per hundred sprays. Japanese rubrum and album lilies are much in evidence at \$3 to \$10 a hundred.

Carnations are much-wanted flowers, but few of these are received at \$1 a hundred; a few field-grown are offered at 50c. a hundred. Roses are somewhat improved in quality and the supply is sufficient. Kaiserin Augusta Victoria at \$4 to \$7 a hundred and American Beauty at \$5 to \$12 a hundred are the most satisfactory roses obtainable. A few good Liberty are received at \$5 to \$7 per hundred.

The flower stands at Tomlinson Hall market presented a much better appearance this week, as masses of garden flowers, well arranged, proved very effective. Business there was reported as exceedingly quiet. I. B.

ST. PAUL.—Business continues very quiet, and apparently stock is becoming much scarcer. It is a difficult matter to obtain good roses, although the price still remains the same. The most of the dealers are getting \$1.50 per dozen for all varieties with the exception of course of American Beauty, which are held at \$5 and \$6 per dozen. Little is going on in social lines. Funeral designs and bunches are about all that keep us moving, and some of the trade have been fortunate in turning out considerable work at a good profit. Sweet peas are now at their best and sell well, the average rate being \$1 per 100.

New stock in roses is coming on very slowly and this market is practically supplied by Chicago in the rose line.

The florists' outing is scheduled for August 8, and if all attend who have agreed to Mr. May will undoubtedly have his hands full in entertaining the crowd. PAUL

CHANGES IN BUSINESS.

PITTSBURG, PA.—The Ziegler Company has been incorporated; capital \$30,000. Incorporators are: J. F. Ziegler, Raymond B. Brown and J. T. Brown, Jr., all of Pittsburgh.

GUADALAJARA, MEXICO.—Alejo C. Federico, a former California nurseryman, has purchased four blocks of the Oblatos colony, just east of this city, for \$24,000. He will establish an up-to-date nursery. Mr. Federico has now a stock of 75,000 young fruit and ornamental trees and shrubs, and this stock will be considerably increased within the next few months.

JOLIET, ILL.—The Joliet Nurseries have been organized for the purpose of growing trees, shrubs and plants, landscape gardening and conducting general

nurseries with a capital stock of \$10,000. The first board of directors is composed of James H. Feriss, George A. Barr, T. C. Shepherd, Sr., T. C. Shepherd, Jr., and Fred Bennitt. The duration of the concern is ninety-nine years.

LEXINGTON, KY.—S. S. Kelley, is building three greenhouses, each 20x100 feet, and will engage in the florist business here. Work on the houses has already begun. Mr. Kelley is not a stranger to Lexington people, having been head florist at J. B. Haggins' Elmdorf farm for a number of years. He is a native of Lexington and has been identified with the florist's business for thirteen years. Mr. Kelley will open an office in the downtown district as soon as the greenhouses are completed and will keep on hand there a supply of cut flowers.

Syracuse, N. Y.

Trade News.

Business is quiet now, as is usual at this time, but all the florists are well satisfied with the season's trade, are looking forward to a large increased sale the coming Fall and Winter, and are preparing accordingly.

There has been more than the average amount of rain, and the nights have been quite cool, the glass often registering 48 and 50 degrees. Carnations have made a fine growth up to the present; none have been housed yet, but there will be quite a lot put in shortly.

L. E. Marquisee is making extensive repairs and alterations. He is planting one house with roses; these are to be in solid beds. The stock looks very promising. Some solid beds, too, are to be used for carnations as a trial. Asparagus and ferns are to be more extensively grown, as his increasing retail trade demands this. He is cutting some fairly good asters from the field. His 60,000 carnations are grand; Marchioness and Enchantress are splendid.

P. R. Quinlan is busy getting things in shape; his chrysanthemums are looking well and one house of Richmond rose is very promising.

Gustave Bartholome has bought three acres of land on Manlius street, not far from his old stand, and is busy grading and moving his houses. He will greatly enlarge his plant and have everything compact and up-to-date. Concrete walls are to be used.

Peter Kay is to move his houses from Teal avenue to Manlius street.

Henry Morris is about to install a new boiler for his plant.

The New York State fair will be held September 9 to 14 inclusive. The premium lists are in the hands of the printer and will shortly be issued. Those having novelties or specialties would do

well to make an exhibit as I feel sure it would pay. Copies of the prize lists may be obtained free by addressing the secretary, State Fair, Albany, N. Y. H. Y.

Indianapolis.

Current Topics.

P. J. Hauswirth, en route to Madison, Ind., visited here Monday.

The Indianapolis delegation for the S. A. F. convention will include the following: Messrs. Sydney Smith, Henry Rieman, John Grande, Herman Junge, Anthony and George Wiegand and Irwin Bertermann.

Baur & Smith have begun the erection of a new rose house.

William Billingsley and John Hartje have returned from their Western trip much elated over the possibilities of the florist business on the Pacific slope.

The Indianapolis Water Company is to remodel its conservatory at the Riverside pumping station.

Harry Jones, bookkeeper at Bertermann's, is spending his vacation with relatives in Northern Indiana.

The young employees of the local florists held a picnic at Leonard's Grove the past week. Among the amusements were various athletic events. Much enthusiasm was displayed and it was decided to form a permanent club. The first meeting is to be held August 8 at A. Weigand & Sons. All wishing to join are asked to report at the meeting.

Bertermann Brothers Company are employing Huns to refill their carnation houses with soil. I. B.

FIRMS WHO ARE BUILDING.

AURORA, ILL.—An addition of 60x40 feet is being made to the Batavia Greenhouses.

BRAINTREE, MASS.—Waldecker Brothers, florists, are preparing to erect another large greenhouse.

ST. LOUIS, ILL.—C. A. Juengel has secured a permit to erect another greenhouse on his premises.

FORT DODGE, IA.—A large force of men has been started to work re-erecting the Larson greenhouses near Central avenue and Sixteenth street. The buildings were torn down some time ago to make room for the new warehouse of the International Harvester Company and a portion of them will be erected on the vacant lot to the west of where they formerly stood.

CROMWELL, CONN.—G. R. Ludwig, for many years bookkeeper for A. N. Pierson, has severed his connection with that house.

WINONA, MINN.—Kirchner & Son are installing a new heating plant.

Cincinnati.

News Gittings.

A pictorial postal card, received from Lucerne, Switzerland, announces the arrival in that city of J. Charles McCullough, seedsman. The picture is interesting—a scene laid among antique furnishings, and a stout maiden bearing six steins of—something.

The florists' outing took place on August 1. All the usual sports were indulged in, and everybody present enjoyed themselves, thanks to D. Rusconi and Henry Schwarz. In the ladies' bowling contest Mrs. Charles Pfeiffer won first prize with a score of 124. The winners in the men's bowling were: First, William Kirkpatrick, with a score of 175; second, C. E. Critchell, 171; third, James Allan, 150. The baseball game was won by a mixed team captained by Harry Baer against the Growers; score 10 to 3.

Last Sunday morning word reached me of the death of George F. Brehmer, who passed away suddenly on July 16. Mr. Brehmer was one of the pioneer florists of Chillicothe, O., a man truthful and honest in all his business dealings. We regret exceedingly his taking away, and extend our sympathy to his bereaved family.

E. G. GILLET.

News Notes.

The Summer exhibition of the Massachusetts Horticultural Society was the smallest Saturday show of the season; in fact, the hall was not nearly filled like what it has been at every other show this year. It was intended as an exhibition of hardy annuals, but their scarcity in the exhibition hall would almost go to show that there are not so many of these flowers grown as in former years. The only exhibitor of these flowers was Mrs. E. M. Gill of Medford. Perennial phloxes were staged by T. C. Thurlow & Company, Mrs. C. S. Pratt and the Blue Hills Nurseries. W. W. Rawson & Company made a display of hybrid nicotianas, sweet peas and dahlias, receiving an award of honorable mention for the former.

Considerable interest is being manifested here in the proposed change of name of the S. A. F. to the Society of American Horticulture as suggested at the March meeting of the board of directors by J. K. M. L. Farquhar. There is quite a feeling that the proposed name would be greatly to the advantage of the society and bring it into closer relations with other horticultural or semi-horticultural organizations, and that as the name would imply it would be the recognized head of horticulture in America and do much more good than it ever can while it holds the lengthy appellation it now does.

State Vice-President Peirce is working hard to have a large representation from this city at the S. A. F. convention in Philadelphia, and while yet he has not had many replies to the postals he has sent to all horticulturists in this section, he is confident of a good-sized delegation, and arrangements will likely be made whereby the party may travel in a special car to the City of Brotherly Love.

Henry M. Robinson has returned from several weeks' stay in New Hampshire, and his brother Charles has gone on his vacation, while J. Margolis of the same firm is waiting patiently to take in the S. A. F. convention.

Paul Richwagen is spending his vacation at the Cape. J. W. DUNCAN.

NORWICH, CONN.

The New London Horticultural Society held a successful sweet pea exhibition on Tuesday, July 30. The displays embraced the best varieties from noted English hybridists, who have made a study of the flower and for that reason the exhibit of the Morton F. Plant estate, Thomas W. Head, superintendent, including 48 different varieties was the center of attraction. This included all the new varieties, among them Nora Unwin, E. J. Castle, Mrs. Alfred Watkins, Frank Dolby and Tom Bolton, all of which were something new this year. This exhibit took the gold medal. The other exhibits were also of a high standard.

acre piece that he owned, and has also procured a lease of another adjacent tract and is at work moving hotbeds and frames to make room for seven new houses of the same size and shape of the eighteen which now constitute his range, and which are each 20x100 feet. The whole range of twenty-five houses is to be devoted to commercial pot plants. This establishment is noted for the perfect arrangements and first class order maintained and well deserves its reputation. Palms and other decorative plants are grown in quantity. Enough pot grown chrysanthemums are now in 8-inch pots plunged in frames outside to fill several houses this Fall, and 6,000 fine young cyclamen are also in frames while enough small poinsettias are having their last shift before going into pans for the Christmas trade, to fill two more houses. Several houses are devoted to the various forms of nephrolepis, about 11,000 of which are now ready to pot. About 200,000 small ferns in variety are yearly sold, and the annual product of small asparagus plants reaches over 40,000. This Fall another storage house, 25x100 feet, will be erected for the accommodation of azaleas and bulbs, of which a large stock is grown in pots and pans. A double water system is in operation throughout the plant, as in addition to the city system there is a driven well from which an electric pump supplies water to all the houses, which is especially valuable in the Winter as this water is fully fourteen degrees warmer than the lake supply. The Garfield Park Flower Company is a concern of the past, but as may be judged from the above Frank Oechslein will continue an active factor in Chicago's plant trade and is certainly to be congratulated on the success he has achieved in six years at the West side establishment.

Louis Wittbold has completed the practical manufacture of cement benches on ideas which he has been at work for some time, and has permanent specimens of the results of his labors now on exhibition at the Buckingham place range. These were erected at a slight advance over the cost of wooden construction, and are expected to last as long as required. He expects soon to have a patent on the moulds.

Herman Meyers, formerly of Chicago and more recently of St. Paul, has entered the employ of Jensen & Dekema as foreman.

Fisher Brothers of Evanston have placed an order for a No. 5 Kroeschell hot water boiler.

C. O. E. Boehm, formerly of this city, Superintendent of Parks of Davenport, Ia., called on his old friends there last week.

This year completes the half century of uninterrupted progress of the John C. Moninger concern, at the headquarters of which work continues to be brisk. The city has repaved the streets in the neighborhood of the Moninger yards making a vast improvement in the approaches.

It is now fifty years since George Wittbold established himself in Chicago, and to commemorate the half century anniversary the stores of the George Wittbold Company were closed on Saturday last and the employees, numbering four score, were invited to a day's outing at the Edgebrook greenhouses and nursery of the concern, whence they were conveyed in wagons and where a delightful day was enjoyed by the participants. The weather was perfect, and music, minstrels, and all sorts of sport, recreation, and entertainment were included in the day's programme.

Though prices have been low, and it must have required a lot of work, it is with satisfaction that E. E. Pieser, in looking over the Kennicott Brothers Company's books last week, discovered to his surprise that the total amount of sales was larger in July than in the month of January.

"Cheer up," is a neat sign displayed over the desk of Percy Jones, in the Flower Market, and he says he thinks it good advice to all at this season of the year.

A. F. Longren, well known to the trade as the traveling representative of the Chicago Carnation Company, has decided to branch out for himself in the rooted cutting and plant business. Being thoroughly conversant with the requirements of the trade, and having secured the agency of several good growers, he should have no difficulty in attaining satisfactory results. He makes his headquarters at Des Plaines.

THE FLORISTS' EXCHANGE,
2 Dnane Street, New York.

P. O. Box 1697.

E. G. Hill, looking hale and hearty,
has been spending a few days in this
city.

Otto Goerisch is accepting congratula-
tions on the arrival of a very young
lady at his home last week who has
taken up a permanent residence.

T. E. Waters has joined the A. L.
Randall force on the supply department.

Adolph Poehlmann anticipates with
pleasure a trip after the convention to
New York and Boston in the neighbor-
hood of which latter city he was located
just twenty-five years ago.

Owing to the absence of some mem-
bers of the E. H. Hunt store staff
on vacation C. M. Dickinson had an
opportunity last week to prove that he
had not "forgotten how," when an or-
der was received for a special design of
wheat sheaves not in stock, and we
may add that the work was perfectly
executed.

There is considerable convention talk
among the trade, but it seems in many
cases to be uncertain whether to partici-
pate or not. It is not probable that
there will be as large a delegation as
visited Dayton last Summer when a spe-
cial train conveyed the party thither, yet
it is safe to say that a good representa-
tion of the trade will find its way to
Philadelphia week after next.

Thomas Chapman of Denver, Col.,
was a recent visitor: before his return
home he will visit Manitoba.

A thorough renovating is under way
at the J. B. Deamund Company's store.

Among recent visitors were Mrs. E. E.
Shed, Valparaiso, Ind.; W. A. Mitchell,
St. Joseph, Mo.; A. Aggerholm, Onarga,
Ill.; C. S. Ford, Philadelphia, Pa.; Mr.
Lauterbach, Bushnell, Ill.

WILLIAM K. WOOD.

Columbus, O.

Club Outing.

The second annual outing of the
Columbus Florists' Club, which was
held the latter part of July, proved
quite a success, the attendance being
about twice as large as last season.
early in the morning of the appointed
day the club took cars for Buckeye Lake,
some 30 miles east of the city, where
a very enjoyable day was spent in boat-
ing, fishing, and also with the games
and contests generally popular on such
occasions. President Stephens, secre-
tary McKellar and the committee on
outing did everything in their power to
make things pleasant.

News Notes.

James McKellar, formerly with
the Graff Brothers, has associated him-
self with the Fifth Avenue Floral Com-
pany, where his long experience in the
business and acquaintance with city
trade cannot but make him an import-
ant factor in that concern's operations.

The Columbus Floral Company has
changed to new and more central quar-
ters, having taken part of a popular re-
tail drug store's room opposite the
State House grounds.

E. Metzmaier has added a neat
propagating house to his already very
complete range.

The Fifth Avenue Floral Company is
making fine progress in its program of
expansion, with one of the largest and
finest plants in this part of the State.
The growing stock now includes upward
of 20,000 carnations, 17,000 chrysan-
themums and 10,000 roses.

Although fairly entered on the dull
season, local florists generally are mak-
ing extensive preparations for what
promises to be a very active and pros-
perous season.

BRYN MAWR, PA.—Richard Neal
Gardner, son of John G. Gardner of the

on August 3, for a three months' trip
to Europe. Mr. Gardner will specially
look up the massing and planting of
evergreens for landscape effects and gen-
eral planting of evergreens and varieties
hardy enough to withstand our Winters
east of Washington, D. C. He will visit
the French, German and Holland grow-
ers.

Baltimore.

News Items.

On Thursday of last week Wm.
Fisher rounded out 50 years of service
as gardener at Evergreen, the beautiful
estate of W. H. Buckler, recently ap-
pointed secretary to the American em-
bassy at Madrid. On August 1, 1857,
Mr. Fisher first entered the employ of
the Buckler family; he is part of the
old place and is regarded almost as
one of the family. Mr. Fisher has lost
only about one month in 50 years of
service, and that was caused by an ac-
cident on the cars some time ago. He
lives in a snug tenant house on the
place with a married daughter, his wife
having died about ten years ago.

Carroll Park contains a rare collec-
tion of coniferous, flowering and orna-
mental trees. The Park Commission
has recently purchased a large tract of
land which will be known as the
Gwynn's Falls extension to Carroll
Park; it is covered with a natural
growth embracing a great variety of na-
tive trees and shrubs, which, together
with the stream and falls, will make
one of the most picturesque spots in
the country. The Olmstead Brothers
are now at work preparing the plans
for the development of the new Gwynn's
Falls Park. C. L. S.

Rochester, N. Y.

News Items.

An interesting visitor here last
week was Charles H. Totty, President
of the New York Florists' Club, he be-
ing in this vicinity on a vacation trip,
during which time he fulfilled the duties
of decorator at the annual Canandaigua
regatta in a most satisfactory manner.
Incidental talks on florists' clubs and
the S. A. F. in particular will result in
several of the craft being in Philadelphia
during convention week.

Another familiar face was that of Fred.
Lord of Lord & Burnham Company,
who is here to confer with Dell Titus
regarding the erection of a new vegeta-
ble greenhouse, 40x300 feet, also in re-
lation to some new houses for George
Crooke Company, this firm having de-
cided to build two new houses.

Among the novelties to be exhibited at
the S. A. F. convention will be the pot
handle, or basket device patented by
George Hart, he intending to take ad-
vantage at that time of introducing it
to florists and the trade in general, and
according to the views of local buyers
who have already had occasion to test
its business value, its success is assured.

We are being treated to some glorious
weather here, too cool perhaps for some,
but deeply appreciated by those of us
who have to be inside most of the time.
Cut flowers of every description are
plentiful, and an abundance of funeral
work keeps store men busy.

From the present outlook there will be
quite a shortage of carnation plants, as
growers are now beginning to place
orders for all varieties.

James Vick's Sons, who have gone ex-
tensively into the bulb business, report
an exceptionally bright outlook for a
good Fall trade. COCKNEY.

NEW BEDFORD, MASS.—Stock is
very scarce. White flowers are in good
demand. A few carnations are still to
be seen, but of very poor quality. Sweet
peas are doing very well; they sell all
the way from 15c. to 50c. per 100, at
retail. Roses are of poor quality; it
is hard to get good stock now.

R. H. Woodhouse and family are away
on a two weeks' vacation at Lake Mir-
ror, N. H. George N. Borden, his fore-
man, reports funeral work as quite
heavy and stock scarce. Mr. Woodhouse
lost all of his outdoor planted asters.

Benches are now being emptied,
cleaned and repaired for the young car-
nation stock. Chrysanthemums are
looking fine and promise a good crop
later.

Peter Murray is kept very busy just
now superintending the erection of his
new houses. HORTICO.

Prices Advertised in these Columns are for **THE TRADE ONLY**—When Writing Please Mention
THE FLORISTS' EXCHANGE.

New York.

The Week's News.

The transportation committee of the Florists' Club is perfecting arrangements to take the delegates from this city and vicinity of Philadelphia, to attend the convention of the S. A. F. O. II. in the usual comfortable and luxurious style. The trip will be made on Tuesday, August 20, over the Pennsylvania Railroad, leaving West Twenty-third street at 9.55 a. m.; Desbrosses and Cortlandt streets at 10 a. m. Special cars will be provided and the committee will see to it that a generous supply of refreshments, liquid and otherwise, will be on board the train, so that the delegates who travel together will arrive in Philadelphia without suffering from the fatigue of either thirst or hunger. All those who intend going should notify Secretary John Young, 51 West Twenty-eighth street, as early as possible. All florists, whether members of the New York Florists' Club or not, are invited to travel in the special cars, and Mr. Young will be only too glad to supply any further information desired.

It is expected that the delegates from Boston will arrive in New York by boat on the morning of Tuesday, August 20, and will travel in company with the delegation from this city.

The building at 170 Fulton street was destroyed by fire on Monday afternoon last. Two floors, with cellar and subcellar were occupied by the F. O. Pierce Company, manufacturers of Mastica, the well known glazing material. It was in this same building on the third floor, that The Florists' Exchange was born, in the year 1888, and where for years the paper had its home, so we chronicle with regret the destruction by fire of the place from which we sent out our initial number.

W. H. Traendly, who for some years had conducted a retail store at Seventeenth street and Sixth avenue, died on Friday, August 2, from an attack of inflammatory rheumatism. The interment took place on Sunday, August 4. He was about 45 years of age.

H. E. Froment expects to leave about the middle of the month to spend a few weeks in the Catskill Mountains.

John Young is giving his store a thorough renovating; paper and paint are being applied and the whole interior will be as bright as a new dollar by the time the Fall business commences.

John G. Esler, secretary of the Florists' Mail Association, made a trip to Lancaster, Pa., this week to confer with Treasurer A. M. Herr on mail matters.

Gunther Brothers have finished the remodeling of their store at 114 West Twenty-eighth street; the show window is now on a line with the street and the extra room that the extension of the window has provided, gives the firm very commodious quarters.

Joseph Fenrich comes up from Ashbury Park, where his family is staying, twice a week. On Tuesday he was telling about a whale, quite a monster, he saw down off the Jersey coast. Joe has in his store a baby's high chair which was evidently too big to take to Ashbury Park; it is quite a monster, too, and worth going to see.

James D. Cockroft, the carnation grower at Northport, L. I., will go to Virginia this week for a week's fishing. He belongs to a fishing club down there, and can get much more sport than can be found on Long Island Sound, he believes.

M. Ford is back from a three weeks' vacation spent at Stamford, N. Y., and Lake George; William Ford will leave next week for Pennsylvania, where he will spend a few weeks enjoying farm life.

Charles Schenck, with Mrs. Schenck, is expected to arrive from Europe to-day (Saturday) where they have been spending their honeymoon.

B. Slinn, Jr., has returned from Arizona, and is now enjoying the sea breezes at Ashbury Park.

Eugene Dailledouze has been having a twist with his old enemy, lumbago; we are glad to say he is improving rapidly and able to be about again.

C. W. Ward has returned from Detroit where he went on a business trip a short time ago. His health is much improved.

Patrick O'Mara, of Peter Henderson & Co., leaves in a few days on his annual vacation.

In view of the fact that the gladiolus

The Whilldin Pottery Co. STANDARD FLOWER POTS

Our output of Flower Pots is larger than any concern in the World
Our Stock is always Large and Complete

Main Office and Factory,

WAREHOUSES: JERSEY CITY, N. J. LONG ISLAND CITY, N. Y.

America, is now coming into the New York market in quantities from growers outside of Floral Park, N. Y., and that the variety is so distinct and meritorious that any grower would recognize its superiority at first sight, it would seem that the contention made that the variety was disseminated previous to its being sent out by John Lewis Childs is not well founded, for most assuredly a variety like America could not be in commerce long without becoming known all over the country. It is the finest gladiolus in our market to-day, and is bringing higher prices than any other variety.

Alex. McConnell, the Fifth avenue retail florist, sailed for Europe, on Wednesday, July 31, on board the Oceanic. Mr. McConnell expects to be away about twelve weeks. He will visit his birthplace—the Isle of Man—also France, Germany and England.

Newport, R. I.

School Gardens.

Last year school gardens were started in Newport with successful results. There was no recognition then of the efforts of teachers and children by the Horticultural Society; this year, however, Mr. Butterton, the president, and Mr. MacLellan and others interested themselves in the movement and were mainly instrumental in the offering of premiums by the Newport Horticultural Society for the best school gardens. It was only reasonable to expect that the prospect of winning a prize, however small, was a wonderful incentive to the little gardeners. The gardens and their products are this year a credit to both pupils and the teachers who prompted them in their endeavors. Next week these gardens will be inspected by Messrs. Butterton, MacLellan and McIntosh.

This seems to be an exceptionally favorable season for Crimson Ramblers roses; for the past two weeks they have been gorgeous in the extreme all over Newport. The several other varieties of climbing roses, including Dorothy Perkins, The Farguhar and Lady Gay (all pink) have also flowered in great profusion here.

Notwithstanding the fact that in Nephrolepis elegantissima and N. Whitmani we have ferns that are almost perfect in beauty of form and useful as well, there is much interest taken by private gardeners in the two new varieties recently shown here by Henry A. Dreer—Nephrolepis todeacoides and N. Amerpohli. Several gardeners who were unable to visit the show where the plants were exhibited but noticed the mention made of them in these columns and elsewhere, are making further inquiries regarding them, preliminary to securing more or less of a supply.

Although plants and flowers are grown here for the Summer trade in considerable numbers and of great variety, there are some things that are never over plentiful; among these are orchids, gardenias and Farleyense ferns. Gardenias sometimes bring an amazingly high price, while Adiantum Farleyense is so hard to get both in plants and in cut fronds that very often orders for them remain unfilled. Orchids are also so extremely scarce there in the market that every one is spotted immediately it makes its appearance.

EDWARD MacMULKIN,
194 BOYLSTON ST., BOSTON, MASS.

Gardener (Greenhouse Work.)

The United States Civil Service Commission announces an examination on August 28, 1907, to secure eligibles from which to make certification to fill a vacancy in the position of greenhouse gardener, at \$600 per annum, in the Bureau of Plant Industry, Department of Agriculture, and vacancies as they may occur in any branch of the service requiring similar qualifications.

Attention is invited to the fact that applications for the position of gardener may be filed at any time, but only those filed in complete form with the United States Civil Service Commission, Washington, D. C., prior to the hour of closing business on August 28, 1907, will be considered for the specific vacancy mentioned.

Persons who have had no experience in addition to that acquired in the ordinary farmer's garden are not suitably qualified for this position, and only persons who are thoroughly experienced in handling plants under glass should apply for this examination. Applicants must state fully in their applications the experience they have had in greenhouse work.

No educational test will be given, and it will not be necessary for applicants to appear at any place for examination.

The examination will consist of the subjects mentioned below, weighted as indicated:

Subjects.	Weights.
1. Age	20
2. Physical condition	20
3. Experience	60

Total

Age limit, 20 years or over on the date of the examination.

This examination is open to all citizens of the United States who comply with the requirements.

Applicants should at once apply to the United States Civil Service Commission, Washington, D. C., for application Form 1093. No application will be accepted unless properly executed and filed as indicated above. In applying for this examination the exact title as given at the head of this announcement should be used in the application.

DOVER, N. H.—Charles Howe, florist, has sailed for Europe. Mr. Howe expects to visit England, Scotland, France and Germany before he returns.

1170 Broadway, New York

H & C

St. Louis, Mo.

News Notes.

Senator Dunlop, of Illinois, president of the Apple Growers' Congress, has called a meeting of the congress for next week, Tuesday and Wednesday, to be held at the Southern Hotel. W. H. Williams of Hannibal, Mo., is secretary. The directors of the Missouri Botanical Garden have extended each delegate an invitation to attend the Henry Shaw Banquet on Wednesday night, August 14, to be given at the Southern Hotel.

Henry Kahos, who has charge of the floral department of Grimm & Gorley, received the sad news on Saturday that his wife died in Buffalo while on a visit there. Mr. Kahos left that night to bring the remains home. The funeral will be held this week from the family residence.

Mr. Hippert and his son, florists at Desoto, Mo., spent Monday in the city visiting wholesalers and growers. They are now rebuilding and making improvements for the coming season.

Fred. Alves, of Augermuller's, and George Schriefer, of Kuehn's, are taking their vacations this week.

Alex. Siegel, with his family, has returned from a two weeks' trip up North; he says he spent most of his time fishing in the lakes.

Ulrich Arnold, for the past twelve years gardener at O'Fallon Park, died suddenly the past week. Mr. Arnold had many friends in the trade who attended the funeral, which took place on Saturday.

Articles of incorporation have been filed by the St. Louis Horticultural Society. It is stated in their application that the society's aim is to conduct flower shows and to hold State exhibitions, also to establish a bureau of information and provide a lecture course on horticulture. Edward Mallinckrodt is president. O. G. Koenig, secretary and Fred. C. Weber, treasurer. Others mentioned as incorporators are Theo. Miller, A. Meyer, Jr., Harry Young, Fred. H. Meinhardt, Emil Schray and A. Jablonsky.

Charles A. Juengel cannot go to the convention as he is too busy building; Robert Thompson is erecting two new houses for him at his South Fourteenth street place.

F. W. Brunning has moved two of his houses to his new place at Columbia, Ill., where in future he will grow all his stock. He is cutting a fine lot of hardy hydrangeas.

Miss Tillie Meinhardt is visiting her friends, Mr. and Mrs. Vesey, at Fort Wayne, Ind. Mr. and Mrs. Vesey recently celebrated their twenty-fifth wedding anniversary.

W. H. Kruse, on Arsenal street, reports that he has just ended a busy season and will take a much needed rest by attending the S. A. F. convention at Philadelphia.

W. C. Young, State Vice-President of the S. A. F. O. H., is quite busy at present with convention matters, answering all kinds of questions concerning the meeting and railroad rates.

PHILADELPHIA CONVENTION NUMBER.

To be issued August 17, 1907. Beautiful Illustrations. Interesting Reading Matter. The BEST Convention Number we have yet published, which is saying much. An exceptional advertising opportunity; you cannot afford to miss it. Send in your "copy" NOW to enable us to do our best work upon it.

THE FLORISTS' EXCHANGE,
2 Duane Street, New York.
P. O. Box 1697.

Buffalo, N. Y.

News Notes.

W. H. Sievers, Genesee street, has entirely remodeled his store, and expects to have it in good condition by September 1. By honesty, energy and thrift he has made his place one of the best paying flower stands in the city. Mr. Sievers learned the business in some of the largest floral establishments in Berlin, Germany.

W. J. Palmer and son Mark, accompanied by two other gentlemen, have left for the northern woods of Canada for a canoeing and fishing trip, and expect to be away from all civilization for three weeks. Two Indian guides will accompany them.

Jacob Bailey of Kasting's has returned from his vacation which he spent at various places in this vicinity.

Jos. Sangster of S. A. Anderson has returned from Crystal Beach, where he and Mrs. Sangster spent their vacation.

Messrs. Jones and Barber of the Gasser Company, Cleveland, O., were in town on their way home from their vacation, which was spent on one of the large boats plying on the lakes, visiting various places en route. W. H. G.

Utica, N. Y.

The Club Outing.

The committee has about all arrangements completed and all we want will be a good day. As it looks now, the attendance will be the largest we have ever had. A fine program of sports has been arranged. The judges will be J. C. Spencer, Frank Baker and C. W. French; clerk, Seward Hakes; starter, Dr. W. A. Rowlands. Music will be provided by Harry Capes and a quartette from the club. There will be a conveyance at the Union depot to take all to the grove. Look for the sign "Utica Florists' Club."

The Albany Florists' Club has accepted our invitation to be present; we look for a large delegation, and promise all a royal time.

News Jottings.

Fred. Lord of Lord & Burnham Company, was in town last week; he had a couple of boilers to place.

Mr. and Mrs. E. F. Quinn of Norwich called on their way to Syracuse for a few days' vacation. Mr. Quinn reports a fine season. I believe he left an order in Utica for a cooler for his office after the pattern of that of Spencer & Martin.

S. Hakes of Ilion was also calling on the trade last week.

The Standard Steam Trap

is acknowledged the best for the Florist, because it is durable and does its work without trouble and annoyance, saving its cost by the economy in coal bills.

T. H. Pletcher, representing the Roseville Pottery Company, Zanesville, O., was here on business.

Joseph Traudt, Canajoharie, N. Y., was in town a few days ago. He bought a new boiler of Hart & Crouse. Mr. Traudt is doing quite a lot of rebuilding this season. He recently bought the place he has been renting of the Yates Floral Company.

QUIZ.

Hail News.

ORION, MICH.—A severe hail storm visited Orion at six o'clock in the evening of August 1, breaking about two-thirds of the glass in the Lake Orion Greenhouses owned by Andrew Harney of Detroit, and managed by Thomas Evans, ruining five houses of tomatoes and damaging young stocks of roses and newly planted carnations. The plant contains about 30,000 square feet of glass most of which was erected last year. The glass was all single thick, butted without putty and was not insured.

Heating.

Growers' Problems Solved by U. G. Scollay.

I am building a new greenhouse, 65 by 22 feet long; north wall to be 7 feet high, south wall 4 feet high; both sides to have 2 feet of 16x24 glass. The north side will be 2 feet of concrete wall, 3 feet of boards double thick, and then 2 feet of glass; south side wall the same, and 2 feet of glass; house to run east and west and connect with another house on west end with glass partitions. How many runs of pipe will be needed, and would you advise using 1 1/2-inch or 2-inch pipe? The boiler is a Number 16 Hitchings, located in the cellar. HORTICO.

—To maintain a temperature of 55 to 60 degrees in zero weather, I would suggest that you use fifteen rows of 2-inch pipe. The boiler has a capacity of 1,600 feet of 2-inch pipe. You do not state how large the present house is, so I cannot say whether the boiler has sufficient capacity or not. You will always get better results in a house of this kind from 2-inch pipe, and I would not advise using the 1 1/2-inch pipe at all. U. G. SCOLLAY.

WANTED WANTED WANTED

People who are desirous of receiving the best stock in Bulbs, Plants, etc., at reasonable prices!

Prices will be cheerfully given to those applying to
F. W. O. SCHMITZ, Prince Bay, N. Y.

PREPARE FOR CHRISTMAS

Novelties, always sell during the holidays. If you have not already grown them, try some Pink or Rose Speciosums. If potted in July, will flower for Thanksgiving and Christmas. Always useful either for cut flowers or plants. Ask the leading florists in Pittsburg, Cleveland, Detroit, Buffalo, or around New York City. Order to-day. Will ship any time.

Cold storage Lillium longiflorums take about two months to bloom from time of potting; speciosums from five to six months, so that longiflorums wanted for Thanksgiving and Christmas should be planted about Oct. 1, and speciosums in July.

All Cases are Re-packed Before Shipment

Lillium Speciosum Rubrum, 8 to 9-in. bulbs, 200 in case, \$8.00 per 100; \$75.00 per 1000; 9 to 11 in. bulbs, 150 in case, \$12.50 per 100; \$110.00 per 1000.	Lillium Speciosum Melpomene, 8 to 9-in. bulbs, 200 in case, \$9.00 per 100; \$80.00 per 1000; 9 to 11-in. bulbs, 150 in case, \$12.00 per 100; \$115.00 per 1000.

ARTHUR T. BODDINGTON, 342 West 14th St., New York City.

Seed Trade Report.

AMERICAN SEED TRADE ASSOCIATION

George S. Green, Chicago, Ill., president; M. H. Duryea, New York, first vice-president; F. W. Bolgiano, Washington, D. C., second vice-president; C. E. Kendell, Cleveland, O., secretary and treasurer; Leonard H. Vaughan, Chicago, assistant secretary.

JACKSON, MICHAEL—P. H. Gage, who has been with S. M. Estell & Company for the past three years, is no longer with that firm.

OIL SEEDS IN INDIA.—Last year the export figures for all the oil seeds, except linseed, including cotton seed, rape, sesamum, earthen, castor, poppy seed, etc., showed decided increases, and the demand has caused a rise in price, and on most of the seeds the prices tend to rise still higher.

CHICAGO. W. W. Barnard returned last week from a ten days' trip inspecting the concern's pea fields and stock at Sturgeon Bay, Wis., where they contemplate the erection this Fall of a new warehouse and pier.

Leonard Vaughan returned last week from a trip through Wisconsin and Michigan. He reports a good bean crop in sight, as well as peas, though last week's rains in that section threatened the harvest of the latter.

ONION SET CONDITIONS IN LOUISVILLE, KY.—The acreage sown was approximately the same as for the year 1906 and as all of the seed came up remarkably well prospects at first were for a larger crop than the year previous. The largest grower in the vicinity who has usually planted sixty-five acres and has produced some seasons 20,000 to 25,000 bushels did not sow any seed at all this year because his land is affected by smut. There has been some increase among the smaller growers, especially those far out in the country. Onion smut, however, has been quite prevalent in many places causing abandonment of some fields, while in others the yield has been much curtailed. Again weeds, which from too frequent showers could not be destroyed in time, have taken many fields.

Conservative estimates of the crop are about as follows: Total acreage sown approximately 1,000 acres, same as 1906; average yield 1906 approximately 50 barrels per acre (160 pounds at digging), total 50,000 barrels; less for picklers 10 per cent; net yield of sets, 45,000 barrels, or approximately 180,000 bushels of sets. The shrinkage on the crop of 1906 was very heavy after digging, due to too much rain before digging and the large per cent. of foreign seed used for sowing.

For 1907 the average yield is approximately 40 barrels per acre on 950 acres, 38,000 barrels; less for picklers, 2 per cent., approximately; 37,240 barrels net, or 149,000 bushels. Average yield is considered on the entire crop. Usually 10 to 40 pounds of seed are sown per acre, the average being fifty. In every favorable season two barrels of sets are produced on good ground for each pound sown. This season the best yields are only one and one-half

and in most instances on fine ground not over one to one and one-eighth.

Onion sets at Louisville this year are of very superior quality, as will be surmised from the per cent. of picklers, the sets are much smaller in size than for several seasons. About seventy-five per cent. of the crop has been dug up to this week and while some showers have delayed digging on the whole, sets have been harvested in good shape.

Varieties are, approximately, 70 per cent. yellow; 28 per cent. white; 2 per cent. red.—Market Growers Journal.

IMPORTS OF SEED, ETC.—August 6.—Brown Brothers & Company, 200 bags canary seed.

August 8.—R. J. Goodwin's Sons, 8 cases onion seed; to order, 100 barrels clover seed.

August 9.—E. R. Brackett & Company, one box lily bulbs; H. H. Berger & Company, 34 cases bulbs; L. D. Crossmond & Company, 631 cases bulbs; Peter Henderson & Company, 131 cases bulbs, 9 crates bulbs; Hagemann & Company, 67 cases bulbs; Maltus & Ware, 23 cases bulbs; Outerbridge & Company, 117 cases bulbs; F. R. Pierson Company, 33 cases lily bulbs; Vaughan's Seed Store, 169 cases lily bulbs; R. M. Ward & Company, 13 cases lily bulbs. August 10-11.—John Kissack & Company, 50 bags seed; American Express Company, 654 packages bulbs; E. E. Buckingham, 206 cases bulbs; Bobbink & Atkins, 38 cases bulbs; W. W. Barnard & Company, 162 cases bulbs; J. Dunn, Jr., five cases bulbs; R. J. Farquhar & Company, 61 cases bulbs; T. P. Flower, 65 cases bulbs; Peter Henderson & Company, 129 cases bulbs; Henry & Lee, 489 cases bulbs; O. G. Hempstead & Company, 146 cases bulbs; Knauth, Nachod & Kuhne, 72 cases bulbs; Lazarere & Company, 27 cases bulbs; Maltus & Ware, 927 cases bulbs; M. D. T. Company, seven cases bulbs; C. F. Meyer, 419 cases bulbs; H. F. Michell Company, 163 cases bulbs; F. R. Pierson Company, 85 cases bulbs; T. C. Pollock, 46 cases bulbs; J. P. Roosa, six cases bulbs; W. W. Rawson & Company, 51 cases bulbs; Schulz & Ruckgaber, 408 cases bulbs; Stump & Walter Company, 221 cases bulbs; Schlegel & Fotter, 231 cases bulbs; J. M. Thorburn & Company, 125 cases bulbs; Vaughan's Seed Store, 465 cases bulbs; F. B. Vandergrift & Company, 69 cases bulbs; Wakem & McLaughlin, 510 cases bulbs; Weeber & Don, 26 cases bulbs; R. M. Ward & Company, 285 cases bulbs. August 12.—Smallwood & Company, 89 boxes plants; Botanical Gardens, one box plants.

European Notes.

An old English poet once wrote of his wasted life:

"My Spring is past and yet it hath not sprung.

And now I live, and now my life is done."

That is how we feel about our Summer, as on the closing days of July we find our young plants of cabbage so thoroughly frozen at 4 a. m., that our workmen, who are busy transplanting, can only do their work with great difficulty. By midday the air is warm and close, but by 8 p. m. we need an overcoat.

The result of all this is that beets, mangels and broad beans are smothered in black fly which has also invaded the scarlet runner pole beans, so beloved by Britishers. As we get a few showers nearly every day the stems of these plants are full of sap, consequently fall an easy prey. In connection with these frequent rains it is somewhat remarkable that while rain fell on nearly every day in July the total rainfall is less than half as much as in 1906, but this is in a great measure due to the almost entire absence of heavy storms.

The effect of this will be seen not only in the diminished yield of seed but also in the size and development of the grain.

After an unusually long wait new samples of rape seed have appeared on the markets both in London and Rotterdam. Both in Holland and England the acreage is far below the average, and as the stocks of yearling seed of good quality are quite exhausted growers can easily obtain any price they choose to demand for present delivery, while it is quite certain that very high figures will easily be maintained throughout the season.

Stocks of kohlrabi and Thousand-headed kale on hand are so small and the acreage growing is so extensively limited all over Europe, that they cannot be used as substitutes independent of the fact that present (and future) prices for these are simply prohibitive.

Just one word of warning: There is a lot of old rape seed still on hand showing a germination of about 50 per cent.; buyers should remember this when tempting offers reach them.

Growers of rutabaga, who are also grain farmers, have had to commence cutting their seed crops this week so as not to have their harvest work all of a lump. This is a pity, as rutabaga has improved very much and fully developed seed would, in some measure, have minimized the shortage.

New seed of the early turnips is coming to hand quite up to estimates.

Robert Buist of Philadelphia, with some members of his family, is staying at the Carlton Hotel, London, C. C. Massie, Minneapolis, has been in Paris, but is now on his way north.

EUROPEAN SEEDS.

HOLLAND CROP REPORT.—Messrs. Sluis & Groot, seed growers and merchants, Enkhuizen, send us the following report about the present standing of their growing crops:

Although last Winter was not exceedingly severe in our country the frequent and sudden changes of temperature wrought havoc among all biennial articles and even those perennial plants, which usually stand our Winters very well, have suffered very much.

The following articles suffered very heavily: Cabbages, turnips, chervil, kohlrabi, parsley, rutabaga; the consequence of this is, that the plantations of these articles are unimportant.

Moreover we had a very cold and rainy Spring, so that our growing crops generally speaking are three or four weeks behind. Especially for late ripening articles such as beans our crop prospects are far from being promising.

Cauliflower, as a whole promises a good crop.

Witte cabbage, red cabbage, savoy, Brussels sprouts, borecole.—Generally speaking the acreage of these is very small and the yield of many varieties will not be sufficient to cover the requirements. The standing of the growing crops is partly a middling one and partly pretty good. Prices will differ very much according to varieties for quite a few sorts will be very scarce, whereas, on the other hand, there will be sufficient quantities for sale of other sorts.

Turnips, with the exception of a few sorts, have been pretty near entirely annihilated by frost. The remaining plants have developed partly rather well and the other part has only a middling standing. Swedes are next to a failure, because nearly all roots have been destroyed by frost last Winter. The stand of the remaining plants is moreover under a middling one.

Kohlrabi, little sown; stands fairish; mangel wurzel, sugar beet, beet, from present prospects, a good crop is expected.

Carrots the stand is rather thin in many places and the breadth of land under cultivation of this article is not very large. As a whole, prospects are rather fair, but partly bad.

Parsnip, scorzonera, good; usual acreage.

Corn salad.—There had been sown large quantities last Autumn, but a great deal has been killed by frost last Winter. The remaining plants have developed fairly well, so that we hope to have a crop of middling importance.

Radish, Summer. This article is also backward; the plantations are of usual importance and prospects are rather promising at present. Radish, Winter, not much planted; stand pretty promising.

Onions, very small acreage. Stand is fairly good, but in some parts only a middling one; moreover blight appears in some districts. Garlic bulbs, good. Celeriac, the plantations of this article are of usual importance and they look rather good.

Parsley. A very small area has been planted and this article does not look very promising. Borage looks well, but only small quantities have been sown.

Chervil and chervil, curled, average crop, but considerable acreage was lost.

Spinach looks rather promising, but is somewhat late. Cucumbers, pretty good, but there are only few plantations.

Peas, generally good; small acreage. Dwarf beans and running beans are very late owing to very cold weather in the Spring. The general stand is under middling and in some places even bad. English beans, we cannot expect more than an average crop.

FLOWER SEEDS.—Our fields of flower seeds do not look very promising, for these articles are also very backward, owing to the cool weather which has prevailed until now. The consequence is that a great many sorts have only developed poorly, but this will not prevent us from having an average crop if warm weather sets in very soon.

Antirrhinum promises only a medium crop; calliopsis looks all right; campanula, rather promising; candytuft, middling crop; centaurea, good stand; convolvulus, stand good, but very late; dianthus, we will probably have an average crop; eschscholtzia, very good; gypsophila, many plants have perished the remainder is rather good; belichrysum looks promising until now; lobelia, stand very good; mignonette, we will not have more than an average crop of this article; considerable acreage has been destroyed by insects and many pieces of land are rather thin. Mimulus promises a pretty good crop; myosotis looks good; nasturtiums are also very late and until now the flowers are not yet very abundant. Owing to this fact we think that our crops will not be very good; nemophila, good. Pansies, only a very small acreage has been devoted to this article and the plantations do not look very promising; they are very late and this is the reason why we could hardly pick any seeds until the early part of August. Papaver, a good crop; petunia, fairly good, rather late; phlox, the plants are still small; rhodanthé, pretty good; Stocks, Virginia, stand good as yet; Ten-Week stock, rather late; verbenas, good, but very late; wallflower, crop very probably under middling; many plants have been destroyed by frost.

BODDINGTON'S CHRISTMAS SWEET PEAS

BODDINGTON'S EXTRA-EARLY CHRISTMAS WHITE SNOWBIRD. An exceptionally early Sweet Pea for indoor flowering—will bloom six weeks after sowing. Color clear white upon long stems; habit fairly dwarf, and of exceptionally free flowering qualities. Trade pkt. 50c., 1 lb. \$1, 1 lb. \$1.50, 1 lb. \$2.50.

CANARY. Similar to the above, but flowers of an exceptionally good yellow. Trade pkt. 50 cts., 1 lb. \$1, 1 lb. \$1.50, 1 lb. \$2.50.

FLAMINGO. Color scarlet; free-flowering and early. As the crop of this variety was small, we can only send out packets this season for trial. Pkt. 25 cts., 5 packets for \$1.

BODDINGTON'S CHRISTMAS PINK. This is the earliest and most profitable and useful Sweet Pea in cultivation as by sowing the seed under glass in latter part of August, flowers can be cut from Thanksgiving on during the winter months. 1 lb. 30 cts., 1 lb. 50 cts., 1 lb. 75 cts.

BODDINGTON'S CHRISTMAS WHITE. A companion to Christmas Pink. Just as free and profuse a bloomer, and is, without doubt, the finest early white for indoor planting. 1 lb. 30 cts., 1 lb. 50 cts., 1 lb. 75 cts.

Our Fall Bulb Catalogue now ready, if you have not already secured one—send a postcard today. Besides a full collection of seeds for fall sowing it contains a list of over

Two Hundred Varieties of Perennial Seeds

that can be sown now.

Dreer's Convention Month Specials

Cocos Weddeliana

A grand lot of plants in 5 inch pots, elegant graceful specimens, about 24 inches high perfect in every way, something entirely different from what you have been offering to your customers in the decorative line heretofore and a plant which will appeal to everyone, price \$1.00 each, singly or by the hundred. We are also carrying in stock an elegant line of the usual sizes for Fern Dishes in good shape.

2 1/4 inch pots, 5 to 6 inches high, \$1.50 per dozen; \$10.00 per 100; \$90.00 per 1000.

3 inch pots, 8 to 10 inches high, \$2.00 per dozen; \$15.00 per 100; \$140.00 per 1000.

KENTIAS

Although the stock of Kentias generally is scarce not only in this country but also in the Palm centers of Europe, you will find our stock of nearly all sizes very complete, and while some of the medium sizes are not quite as heavy as we have supplied in some seasons past, you will find all of the stock here offered of excellent quality and value.

WE OFFER IN

Kentia Belmoreana

2 1/4 in. pots, 4 leaves, 8 to 10 in. high; per doz., \$1.50; per 100, \$10.00; per 1000, \$90.00.

3 in. pots, 5 leaves, 12 in. high; per doz., \$2.00; per 100, \$15.00; per 1000, \$140.00.

4 in. pots, 5 to 6 leaves, 15 in. high; per doz., \$4.50; per 100, \$35.00.

6 in. pots, 6 leaves, 20 to 24 in. high; \$1.00 each.

6 in. pots, 6 to 7 leaves, 26 to 28 in. high; \$1.50 each.

9 in. tubs, 7 to 8 leaves, 5 ft. high, very stocky; \$10.00 each.

11 in. tubs, 7 to 8 leaves, 6 ft. high, very stocky; \$20.00 each.

11 in. tubs, 8 to 9 leaves 7 to 8 ft. high, very stocky; \$25.00 each.

We especially call your attention to the three sizes offered at \$10.00, \$20.00 and \$25.00 each; these are handsome specimens, such as you have rarely had an opportunity to buy.

Kentia Forsteriana

in. pots, 5 leaves, 2 to 15 in. high, \$2.50 per doz., \$20.00 per 100.

4 in. pots, 6 to 6 leaves, 15 in. high, \$5.00 per doz., \$40.00 per 100.

6 in. pots, 6 leaves, 24 to 28 in. high, \$1.00 each.

6 in. pots, 6 leaves, 30 to 32 in. high, \$1.50 each.

7 in. pots, 6 leaves, 36 to 40 in. high, \$2.50 each.

7 in. tubs, 6 leaves, 48 in. high, \$4.00 each.

8 in. tubs, 6 leaves, 64 in. high, \$5.00 each.

8 in. tubs, 6 leaves, 54 to 60 in. high, \$6.00 each.

8 in. tubs, 6 leaves, 40 to 42 in. high, \$3.00 each.

9 in. tubs, 6 to 7 leaves, 5 1/2 feet high, \$8.00 each.

10 in. tubs, 6 to 7 leaves, 6 feet high, very heavy specimens, \$12.50 each.

10 in. tubs, 6 to 7 leaves, 7 to 8 feet high, tall decorative plants, \$12.50 each.

12 in. tubs, 6 to 7 leaves, 8 to 9 feet high, tall decorative plants, \$17.50 each.

Kentia Forsteriana—Made-up Plants.

7 in. tubs, 4 plants in a tub, 34 to 36 in. high, \$2.50 each.

7 in. tubs, 4 plants in a tub, 36 to 38 in. high, \$3.00 each.

8 in. tubs, 4 plants in a tub, 40 to 42 in. high, \$4.00 each.

8 in. tubs, 4 plants in a tub, 42 to 48 in. high, \$5.00 each.

8 in. tubs, 3 plants in a tub, 4 1/2 feet high, \$6.00 each.

9 in. tubs, 4 plants in a tub, 4 1/2 to 5 feet high, \$8.00 each.

10 in. tubs, 4 plants in a tub, 6 feet high, \$10.00 each.

12 in. tubs, 4 plants in a tub, 6 feet high, \$12.50 each.

Kentia Belmoreana—Made-up Plants.

12 in. tubs, 4 plants in a tub, very bushy plants, 6 ft. high, \$15.00 each.

Areca Lutescens

3 in. pots, 3 plants in a pot, 12 to 15 in. high, \$1.25 per doz.; \$10.00 per 100; \$90.00 per 1000.

4 in. pots, 3 plants in a pot, 15 in. high, \$3.60 per doz.; \$25.00 per 100; \$225.00 per 1000.

6 in. pots, 3 plants in a pot, 24 to 26 in. high, \$1.00 each.

Latania Borbonica.

2 in. pots, 60 cts. per doz.; \$4.00 per 100; \$35.00 per 1000.

2 1/4 in. pots, 75 cts. per doz.; \$5.00 per 100; \$40.00 per 1000.

3 in. pots, \$1.25 per doz.; \$10.00 per 100; \$90.00 per 1000.

4 in. pots, 5 to 6 leaves, 12 to 15 in. high, \$2.50 per doz.; \$20.00 per 100.

6 in. pots, 6 to 7 leaves, 15 to 18 in. high, \$6.50 per doz.; \$50.00 per 100.

Araucaria Excelsa—(Norfolk Island Pine)

Our stock of Araucarias is very complete in all sizes; we are especially strong on the smaller sizes which are now so popular. The plants are all of good value, and will be found a profitable investment to grow on for Winter sales.

4 in. pots, 5 to 6 in. high, 2 tiers, 40 cts. each.

5 in. pots, 8 to 10 in. high, 3 tiers, 65 cts. each.

6 in. pots, 12 to 14 in. high, 3 to 4 tiers, 75 cts. each.

6 in. pots, 14 to 16 in. high, 4 tiers, \$1.00 each.

6 in. pots, 16 to 18 in. high, 4 tiers, \$1.25 each.

Araucaria Excelsa Glauca.

5 inch pots, 8 in. high, 2 tiers, 75 cts. each.

6 in. pots, 13 to 15 in. high, 3 tiers, \$1.25 each.

Araucaria Robusta Compacta.

6 inch pots, 8 in. high, 2 tiers, \$1.00 each.

6 in. pots, 10 in. high, 2 to 3 tiers, \$1.25 each.

6 inch pots, 12 in. high, 3 tiers, \$1.50 each.

Fine Ferns

NEPHROLEPIS BOSTONIENSIS.

(The Boston Fern) 6-inch pots, 50 cts. each.

NEPHROLEPIS SCOTTII.

(The Scott Fern) 6-inch pots, 50 cts. each.

NEPHROLEPIS WHITMANI.

The Improved Ostrich Plume Fern.

Unquestionably the most valuable of this type superseding Piersoni, Barrowsi and Elegantisima all of which we have now discarded in favor of this variety. Not only is the pinna on the individual fronds more finely divided, but the fronds are denser, broader and more graceful and the habit of the plant is more perfect.

2 1/4-inch pots, 75 cts. per doz.; \$5.00 per 100; \$40.00 per 1000.

6-inch pots, 75 cts. each.

NEPHROLEPIS AMERPOHLI.

This is the latest addition to the Ostrich Plume type and is certain to prove a welcome and popular variety, holding for delicacy and gracefulness the same position among the Nephrolepis that Adiantum Gracillimum does among the Maiden Hair Ferns. The pinna is so finely divided that it reminds one of a piece of fine lace, the fronds are broad and of a depth which gives them a cushion-like appearance. It forms a beautiful specimen and is admired by everyone who sees it. We are now booking orders for September delivery.

50 cts. each; \$3.50 per doz.; \$25.00 per 100; \$200.00 per 1000.

NEPHROLEPIS TODEAOIDES.

Todea or filmy Fern-like Nephrolepis.

This is an English introduction that has received a first class certificate both from the Royal Horticultural Society and from the Royal Botanic Society of London, and is likely to become a most important commercial variety. While in a general way it reminds one of an exceptionally well-grown plant of N. Elegantisima it is entirely distinct from this and all others, in its strong yet compact growth and its bold heavy foliage which is distinctly tripinnate or three times divided. Specimen plants which we now have growing are admired by everyone who sees it. We have great faith in its future.

4-inch pots, 50 cts. each; \$5.00 per doz.; \$40.00 per 100.

6-inch pots, \$1.00 each.

NEW DOUBLE BLUE LOBELIA.

Kathleen Mallard.

A charming plant of English introduction, which we are now offering for the first time. It originated as a chance seedling from Lobelia Speciosa and has very large double flowers of an intense rich deep blue color. It is a most desirable plant, which meets with favor with everyone who sees it. We offer good plants for propagating purposes.

20 cts. each; \$2.00 per dozen; \$15.00 per 100.

Begonia Gloire de Lorraine

We are now delivering first class stock of Begonia Lorraine, 2 1/4 inch pot-plants which have been propagated from leaf cuttings and which will make plants that are much superior to stock grown in the ordinary way. You will make no mistake in placing your orders at once; the stock is certain to please you.

\$2.00 per doz.; \$15.00 per 100; \$140.00 per 1000.

For the most complete list of seasonable stock that can be offered at this season of the year see our current Wholesale List. If you have not received a copy it will be mailed to you on application.

OUR EXHIBIT AT THE CONVENTION.

During convention week we will have on exhibition at Horticultural Hall a full line of samples, embracing not only the plants offered above but also many others some of which are certain to prove useful to you in your business and with which you should become acquainted. Our entire staff of travellers will be in attendance and will be pleased to show samples or to pilot you to our nurseries at Riverton, where a personal inspection of our many specialties will prove interesting.

AN INVITATION TO ALL.

Wednesday afternoon, August 21, has been set aside by the entertainment committee of the Philadelphia Florists' Club for a visit to Riverton, and we extend a cordial invitation to everyone to join us on this day. A large steamboat capable of accommodating 3,000 people has been engaged by us for the purpose. The trip up the Delaware River is a most interesting one, and will enable you to gain a good idea of the vast shipping, shipbuilding and many other of Philadelphia's great river-front industries. We will do all that we can to make this day a memorable one in the history of the Philadelphia Convention and we hope that you will be able to join us.

HYDRANGEAS for Forcing

Otaksa and Thomas Hogg with 7-12 flowering crowns, \$12.00; with 5-6 flowering crowns, \$9.00; with 4 flowering crowns, \$7.00

Japonica Rosea (new) with 7-12 flowering crowns, \$20.00; with 5-6 flowering crowns, \$15.00; with 4 flowering crowns, \$10.00

We especially recommend the new Japonica Rosea; color: fine, rich pink, about the shade of Gloire de Lorraine Begonia; coloring is even and does not show the white or washed-out shadings sometimes seen in Otaksa; foliage, uniform deep green, and does not streak nor yellow. Has taken medals in Europe and is a distinct acquisition.

Our plants are grown in pots or doors; they will be taken inside before frost; ready for delivery next month or when wanted.

ROSES field grown, well rooted, especially suitable for forcing. Write for prices. Full Line of ORNAMENTALS, SHRUBS, SHADES, VINES, Etc.

NURSERY DEPARTMENT.

Conducted by Joseph Meehan.

AMERICAN ASSOCIATION OF NURSEYMEN.

J. W. Hill, Des Moines, Ia., president; C. M. Hobbs, Bridgeport, Ind., vice-president; George C. Seager, Rochester, N. Y., secretary; C. L. Yates, Rochester, N. Y., treasurer.

Growth of *Ostrya Virginica*.

A correspondent asks us whether the hop tree, *Ostrya virginica*, would make a good shade tree, as he saw in a farm paper it had been recommended for this purpose. Probably the common name may have been in the mind of the writer as belonging to some other tree, for no one would recommend the *ostrya* as a shade tree. When in suitable situations it makes a large tree, but it is slow growing, and unless well suited it keeps of a shrub-like character for some time. At Concord, Mass., there is a very fine specimen of it in the public park. There are but few nurseries having much stock of the tree even if one desired to set out a row of them.

Besides its common name, hop tree or hop hornbeam, it is also called ironwood. It is closely allied to the common hornbeam, *Carpinus americana*, which has also been spoken of as a shade tree. As a single specimen in a damp place this makes a small tree in time but could hardly be called a shade tree. Whoever has a very damp place on his grounds would find the hornbeam just the thing for it. Treated as a shrub, as so many are, it is a useful and attractive bush.

Trumpet Vines.

At this season of the year, early August, there is always a temptation to praise the trumpet vine as the several kinds flower then, and they are certainly beautiful. The best known is *Bignonia radicans*, which is found wild in many States, and is cultivated in almost every garden as well. Whether as a vine to a wall, clothing a pole or tree, or grown as a shrub, it is always valued, its large, trumpet-shaped scarlet flowers making such a brilliant display and at a time, too, when vines, shrubs and trees are making but little showing. For many years there was in nursery collections a trumpet vine called *Bignonia Thunbergi*, but it was nothing but a variety of *B. radicans*, having flowers of a darker scarlet than the type, and its name, *Thunbergi*, has been dropped. There is, however, a decidedly distinct sort now in cultivation, a yellow flowered variety, known as *B. radicans aurea*.

A distinct and valuable kind is *B. grandiflora*, a Chinese species which bears very large flowers, the color of which is often described as golden yellow, but another description though apparently contradictory—salmon pink—seems to fit it better. At any rate it is a most beautiful kind and being a less rampant grower it blooms at a younger stage than does *B. radicans*. Grown as a bush or tied to a stake, to form a standard, it soon flowers, as all vines do so treated, and then it is one of the sights of the season. As trumpet vines flower in clusters at the end of their long shoots and the blossoms do not all open at once, there is a succession of flowers for some time.

Maackia Amurensis.

Trees and shrubs that flower in Midsummer will always be in demand, and for this reason lovers of trees will be glad to know of the *Maackia amurensis*, a small tree which flowers with us in the last days of July. Although known to cultivation for many years, but few seem to have it in their collections and for this reason it was a pleasure to hear of a nice specimen, some 8 to 10 feet high, in full display of flower in private grounds near Philadelphia recently. Germantown specimens have been flowering for several years, though but 5 to 6 feet high, showing that the blooming period is soon reached; and, too, they flower every season. The blossoms are yellowish white and are produced in a cluster of 4 to 6 finger-like spikes, on the ends of the shoots.

Late botanists take away the name *maackia* from this tree and class it with *cladrastis*, the latter itself being our old acquaintance *Virgilia lutea*. Like the *cladrastis* the *maackia* seeds freely, hence young plants should not be hard to get.

Growing Camphor Trees.

One of our daily papers has this to say concerning camphor:

"Camphor trees won't grow profitably anywhere but in Japan. They yield nothing, even there, till they are forty years old. Then the tree is cut down, and from the whole thing—leaves, bark, trunk, branches, even roots—the camphor is distilled. The process is difficult. The Japs, a far-sighted people usually, made a mistake in the past, and did not preserve their camphor groves as they should. Now, in consequence, there are not enough camphor trees. But the next generation will see this deficit more than corrected; for today, in

Japan, for every old camphor tree cut down ten young ones must be planted."

The writer of the above extract is mistaken in saying the camphor tree will not grow profitably anywhere but in Japan. It will flourish in any ordinary climate where but no more than a few degrees of frost occurs. The trees flourish in Florida, and seedsmen there advertise seeds from their trees and it could be grown in other States as well. It would thrive no doubt in California and in British Columbia, and it thrives even in the extreme southern part of England. There must be a good trade already in the South for young trees, as many Southern nurserymen advertise plants in quantities, but they may be only for ornamental purposes.

At any rate, it is certain the trees could be grown profitably outside of Japan.

Camphor Tree, Natural Growth, at Fullerton, Cal.

Encouraging the Growth of Young Trees.

From being too anxious to make "trees" of their young stock nurserymen often miss it by trimming up their young trees in Summer while growth is still progressing. A row of maples, it may be, which has made a height of 6 to 8 feet. The season has been favorable and the growth has been from the sides as well as the tops, giving the trees the appearance of bushes. As standard trees are wanted in the end, a man is sent with a pruning knife in the Summer and he cuts off every shoot excepting those at the top. This is where a great mistake is made. The more growth such trees make in Summer the stronger they become, and it does not matter where the growth is, whether at the top of the tree or along its sides. To cut off all the side shoots when in the height of growth is a serious check to the tree. The proper way is to let all such growth remain until the end of the season, then remove it, as its usefulness for the season is over. Should it appear evident that the side shoots are adding to their vigor by robbing the top growth, the ends of the growths should be nipped off, which, acting as a check, would cause the sap to flow more to the upper branches.

Young trees treated as recommended will have a much thicker main stem than others which have been trimmed up, and a year's experience will convince anyone that those untrimmed through the Summer are the best. Trim them up when the leaves fall or in Winter when there is not much that can be done among trees and shrubs.

Euonymus Sealei.

In some parts of the country *euonymus* bushes are greatly pestered with the scale known to gardeners as the *euonymus* scale, which looks much like the oyster scale often seen on fruit trees. The young are bred in late Spring, and by the close of July are found thickly covering the foliage of the new growths of the shrubs. As is well known, all oily substances are effective, in a greater or less degree, in killing insects so there seems no reason why bushes should be allowed to present to view leaves full of the scale. Whale oil soap, kerosene emulsion, scalecide, and even pure kerosene have been used with varying success. The *Euonymus japonicus* will endure the kerosene almost pure when the leaves are hardened, as they are in late Winter, and the emul-

sion can be used on it at almost any time. The deciduous sorts, such as *europaeus*, *americanus*, *alata* and the like, are best sprayed when dormant, say, in late Autumn and early Spring.

It is an interesting fact that the *Euonymus Sieboldianus*, an evergreen when not in exposed places, appears immune from this scale; at least it has been in almost close contact with other sorts having scale and has escaped.

JOSEPH MEEHAN.

The Camphor Tree in California.

I have read with considerable interest the accounts which have recently appeared in the various horticultural journals that come to me, of the efforts the United States Department of Agriculture is making to determine whether camphor trees can be successfully grown in commercial quantities for the gum they may produce. It seems strange that the authorities at Washington have not learned ere this time that in Southern California there are trees now growing with trunks two feet in diameter at the base. The accompanying photograph shows a ten-year old tree which is growing in Fullerton; others on the same avenue are quite as large. But this is the only one that has not been trimmed, which shows the great beauty of the tree when left to its own natural growth.

The camphor tree is not particular as to soil, growing equally well in light sandy loam or heavy clay, and does not require as much water for its best development as an English walnut. The jet black berries produced in great abundance by some trees are very pretty, while the new growth and young leaves have a pleasing color not easily described. It is one of our most beautiful ornamental evergreen trees, and will stand 15 degrees of frost without injury.

The Government officials having this matter in charge are respectfully requested to look at these subjects as they grow in this part of the country—an object lesson of what may be done in the production of camphor.

P. D. BARNHART.

SHIPMENTS OF NURSERY STOCK TO CANADA.—The C. S. Warner Company, Niagara Falls, Ont., in sending to The National Nurserymen a draft of the Canadian Customs Tariff in so far as it affects nursery shipments, adds the subjoined valuable particulars:

The following decisions by the Department on the Canadian Customs Tariff will be interesting:

"Forest trees and forest tree seedlings come under item No. 80—exempt from duty although dwarf trees which are sometimes classed as forest trees, for customs purposes come under the heading of shrubs, dutiable at 20 per cent.

"Packages are dutiable at 20 per cent, when containing any of the stock named in items No. 78 or 82, but are not dutiable when only such articles as appear under 79, 80 or 81—even if only a small quantity of 78 or 82 are packed with either of the others, then the value of the box and packing will be dutiable as a whole.

"As before, all stock with the exception of hot house and strawberry plants and evergreens can only be entered during the fumigation season, which for the Fall shipments will open about the beginning of October, although the date is not definitely fixed—it will last two months. In this connection we might say that fumigation is attended to at the frontier and if in the course of your article you can find it practicable to introduce our name, you can with perfect confidence recommend that customs clearance should be effected at the frontier as a means of saving time.

"Shipments billed in our care for this purpose are hurried through the fumigation house, and the railroad and express agents are given no rest until the consignments are once more on their way to destination. Without this service, delays are frequent, resulting in damaged stock and dissatisfied shippers and consignees."

SCHEDULE.

78—Florist stock, viz:—Palms, ferns, rubber plants (Ficus), gladiolus, cannas, dahlias and peonies	25 p. c.
79—Florist stock, viz:—Azaleas, rhododendrons, pot grown lilacs, rose stock and other stock for grafting, seedling carnation stock, araucarias, bulbs, corms, tubers, rhizomes and dormant roots, n. o. p.; seedling stock for grafting, viz:—plum, pear, peach, and other fruit trees.....	Free.
80—Trees, n. o. p. and tussels.....	Free.
81 Trees, viz:—Apple, cherry, peach, pear, plum, and quince, of all kinds and small peach trees known as June buds.....	3c.
82—Grape vines, gooseberry, raspberry, currant and rose bushes; fruit plants, n. o. p.; trees, plants and shrubs, commonly known as nursery stock, n. o. p.....	20 p. c.

The Largest Stock of Shrubs, Vines and Evergreens In This Country

70,000 **Azalea Amoena** of all sizes. Prices range from 5c. to \$3.00 each.

30,000 **Altheas** in named varieties, 2 to 3, 3 to 4 and 4 to 5 ft.

90,000 **Berberis Thunbergii** from 18 to 24 in. to 3 to 4 ft.

Golden Cornus Spathi, 3 to 4 ft., extremely low at \$12 per 100.

30,000 **Deutzias** in variety, of all sizes.

Hydrangea Paniculata Grandiflora, 3 to 4 ft. \$10 per 100. 3 to 4 ft., XXX, very fine, \$12 per 100.

Purple Lilac, 5 to 6 ft., in quantity; also an assortment of named **Lilacs** in standard as well as bush form.

35,000 **Regeliana Privet** (true variety grown from cuttings), 18 to 24 in., 2 to 3 ft. and 3 to 4 ft.

California Privet in large quantities of all sizes up to 8 ft.

75,000 **Spireas** in variety, XX fine, including 30,000 **Spirea Van Houttei** in one block.

Viburnum Dentatum, 2 to 3 ft., 3 to 4 ft., and 4 to 5 ft.; also a good stock of **Viburnum Tomentosum**.

80,000 **Viburnum Plicatum** of different sizes:

18 to 24 inches.....	\$8.00 per 100
2 to 3 feet	12 00 "
3 to 4 "	15.00 "
4 to 5 "	20.00 "

Clematis Paniculata and **Honeysuckles** in large quantities. **Creeping Roses**, 3 years old, including **Wichuraiana Hybrids** in six varieties and the true **Wichuraiana**.

Large Evergreens, 8 to 15 ft. Come and see them.

40,000 **Small Evergreens** for decorating purposes from our own propagation.

Arbor Vitae, 8 to 9 ft.; **Hemlocks**, 6 to 8 ft.; **Austrian Pines**, 3 to 4 and 4 to 5 ft., X fine specimens.

A large variety of **Retinisporas** from 5 to 15 ft.

Boxwood in large quantities for winter decorating purposes. Write us for sizes and prices.

1,000,000 **Hardy Herbaceous Plants**, including 300,000 **Phlox**.

\$100.00 Will be given to any nurseryman who can show as large a quantity of as large sizes of the following 15 varieties of shrubs and vines:

Viburnum Plicatum	Altheas	Deutzia Gracilis	Lilac , in variety	Privet California
Spirea Van Houttei	Hydrangea P. G.	" Lemoinei	Azalea Amoena	Honeysuckles
" A. Waterer	Berberis Thunbergii	Clematis Paniculata	Privet Regeliana	Viburnum Dentatum

If we do not prove that all we have said (and much more) is true, we will pay all expenses of coming to see us.

PLANT CULTURE

The Best Book for the Plant Grower - \$1.00

A. T. DE LA MARE PTG. & PUB. CO. LTD., 2-8 DUANE STREET, NEW YORK

Prices Advertised in these Columns are for **THE TRADE ONLY**—When Writing Please Mention **THE FLORISTS' EXCHANGE**.

(13) **Descriptions of Persian Yellow; Harison and Austrian Roses.**—Please describe the Persian Yellow rose—color and habit; also the Harison rose, color and habit and the Austrian rose.

New Jersey. G. A.

—Bailey's Cyclopedia of American Horticulture says: "Rosa hemisphaerica var. plena has slender stems with hooked prickles, leaflets obovate, cuneate at the base, simply serrate, bluish green. Flowers usually solitary, scentless, light yellow, double; cultivated under the name of Persian Yellow."

"The variety Harison is of a paler color and a little less double than Persian Yellow, but it blooms more freely, is more vigorous, hardier, and easier to grow. It is of American origin and may be a hybrid of Persian Yellow with Rosa spinosissima."

"Austrian or Yellow Brier, small leaflets, solitary flowers, bark chocolate-brown. Very hardy. Will stand very little pruning, producing flowers from the upper end of old wood. Types, Harison, Austrian Copper and Persian Yellow."

(14) **Ivy Growing on a Hickory Tree.**—A party living here has a hickory tree with the Winter or hardy ivy growing upon it, and some one has told him that the ivy will kill the tree. Will it?

New Jersey.

—The ivy will eventually destroy the life of the tree, unless steps are taken to kill the ivy.

(15) **Failure with the Holly.**—Why is it that I can't get a holly tree to live after planting? I have bought some, and have replanted a tree that has grown in this climate, but have no success with either. This place is near the sea coast; has that anything to do with my failure?

New Jersey.

—Perhaps the hollies are being tried in too bleak a location. Given a position where they are protected from high winds, and reasonably small-sized specimens are used, there should be little difficulty experienced in getting hollies established, provided, of course, that a good rich soil is given them also.

(16) **Grapes for Forcing.**—I should like to have William Turner's advice upon the following: Which is best for early forcing of grapes, an inside or outside border or both? also say which is best for midseason forcing; and for late work, and name best varieties for the purpose. Also give the best way for making borders and what to use.

England. H. Y. B. E.

—A great deal depends on circumstances in deciding about graperies borders, whether confining the roots to the inside or allowing the roots both inside and outside. Good grapes are produced by both methods. The style of house and its width should have consideration. Here in the United States the fruit houses, as a rule, are about 25 feet in width, which allows considerable space for the roots; but I will state that for early forcing, by all means confine the roots inside. For midseason and late, provided the fruit houses are well elevated, a six-foot border outside as well as inside would be of benefit in this way—the vines could be made to yield a few years longer by giving this extra six feet.

Varities for early forcing are: Black Hamburg, Buckland Sweetwater and Foster's Seedling; and, with us, it is advisable to have a few to come in a little later, such as Gros Maroc and Royton Muscat. For midseason, Muscat of Alexandria. For the late house, Gros Coleman, Gros Maroc, Madresfield Court and Lady Hutt. Others might be mentioned, but I do not think it wise to crowd so many varieties into one house.

In regard to making the border, the first thing to be considered is the drain-

age. If there is good natural drainage, good and well; otherwise, artificial drains must be made. No good fruit can be produced in a stagnant border. After the drains are put in, a rough coating of concrete and a foot or more of drainage on this concrete should be afforded. The border or depth for soil should be from two and a half to three feet. I have never been a strong advocate of very rich borders; for young vines I would recommend sod procured from an old pasture, soil that has some body—what I would term a medium loam. This may be plowed up and hauled direct to the border, putting it in layers. Bone and wood ashes can be sprinkled in as the border is making. But no hard and fast lines can be drawn. Some soils will take more fertilizer than others, but take bone and wood ashes, one to 40—that is, using inch bone at the bottom, one-half inch on top toward the top of border. Thomson's vine manure may be used, say, 100 pounds to three or four loads. A border made in this way should keep in good condition for years. As the vines grow it is an easy matter to feed from the surface.

WM. TURNER.

PEONIES

St. Louis Gold Medal
Peonies

PEONIES

We offer for Fall sales more than 30,000 salable named plants of our own growing. We have over six acres of PEONIES, densely planted.

We have been growing PEONIES since 1869, years before some growers were born, and claim to know something about them.

We always give satisfaction with the size of our plants, and the correctness of names when they come into bloom speaks for us. We do not claim to have 1,000 or 1,200 varieties, as this number is non-existent, one variety frequently doing duty under 20 different names. This occurs even among the new, high-priced kinds.

All our plants have young roots, and not shelly-barked, thin ones. Please send for our price list of same.

We also offer **THE NEW DOUBLE DWARF WHITE BABY RAMBLER, CATHERINE ZEIMET**. This rose is a beauty, field-grown, own root plants, for Fall delivery. **ANNY MULLER**, The New Pink Dwarf Baby Rambler, field-grown, own root plants, for Fall delivery. **ANCHUSA ITALICA**, Dropmore variety, very strong, blooming plants. The finest, pure blue plant extant. Please send for price lists.

NEW ROSE

Rhea Reid--The Red Beauty

(American Beauty × a Red Seedling)

As double as Bridesmaid and as free.
As red as Richmond and as fragrant.
As big as Beauty and as vigorous.
As easy to grow as Bride and quite as continuous in bloom.
Long and stiff of stem; with a grand appetite for rich food.
A perfect constitution which resists both mildew and black spot.

This Splendid American will
go to the trade March 1, 1908

We recommend it as the FREEST of WINTER FORCERS
and also as a perfect SUMMER BLOOMER

Plant Notes.

PLATYCERUM ALCICORNE.—Although platyceriums are commonly associated with private greenhouse establishments they are nevertheless occasionally noticed doing remarkably effective service in the decorating of florists' stores or show houses. The variety alcicorne is by no means the most striking of these strikingly beautiful plants, but it is the one most generally grown, because of its adaptability to a moderately low temperature and because of being easier propagated than some other varieties. Staghorn ferns, as these are commonly termed, will thrive well in baskets filled with coarse peat and sphagnum moss. They also form beautiful objects of absorbing interest when fastened to a block of wood and hung up in a suitable place. It will be necessary in the latter disposition of the plants to fasten a piece of peat and a little sphagnum to the plant as a matter of sustenance. After the plants get established they will cover the board with their unique fronds and will get along with but little care for years.

ACHIMENES.—When plants of achimenes are done flowering they may be placed on a shelf in a greenhouse until they show signs of going to rest by turning brown. Water should not be withheld until they get into the state referred to, otherwise the bulbs will be seriously injured for another year. When the tops have died down the tubers should be taken out of the pots and stored in sand in a place where the temperature will not fall much below 50 degrees during the Winter; they are easily destroyed by dampness when stored away for the Winter.

PELARGONIUMS are again coming in for a share of attention from commercial growers, and when they are carefully grown there is no question of their ability to make good. It takes a great deal of time and labor to grow such specimens of these plants as we have seen in our boyhood days—plants three or four feet in diameter with the wood tied neatly and firmly to wire frames fastened to the pots. These plants when in full bloom were certainly gorgeous, if a little stiff and artificial in general appearance.

Pelargoniums now standing outdoors require but little water, just enough to keep them from flagging. In about a month they will be in condition for cutting back, the purpose of placing them outdoors being the ripening of the wood, and when the wood is ripe the time is at hand to begin operations anew for another crop of bloom. The plants should be cut back to within two or at most three joints of where last stopped, and then placed in cold frame or cool house and kept somewhat close and moderately dry until they have broken. In order to induce the plants to break, frequent syringing overhead will be necessary, taking care that as little water as possible get on to the soil in the pots until the plants are fairly well broken. When the shoots are an inch or two long the plants should be turned out of their pots and the greater portion of the old soil shaken from the roots. Those roots that are straggly may be cut back, and the plants then repotted into smaller pots than those out of which they were removed. In potting pelargoniums it is very essential that the soil be made very firm, otherwise they will be disposed to run to leaf with little inclination to flower. The plants after potting should be kept near the light and far enough apart to prevent them becoming drawn and weakly.

Pelargoniums thrive well in a moderately cool temperature in Winter; not over 50 degrees suits them better than when it is warmer. The shoots may be stopped about the end of October or early in November, the time for this operation, as in the case of others, depending on when the plants were started, and when they are wintered in a cool house they will require but little water, as the roots of pelargoniums thus treated require to be kept drier than those of most plants in the same stage of growth. As soon as the shoots have broken after being stopped the plants should be shifted into pots one or two sizes larger than those they were last put into, potting firmly as before. If the plants are wanted for early flowering they should not be stopped again, but if they are not needed until May or June they may

be stopped in January or February. As soon as the flower buds are formed the plants will be greatly assisted in the development of bloom by a moderate application of liquid manure once or twice a week.

When the plants are growing luxuriantly with the aid of sun heat in the lengthening days of early Spring green fly is almost sure to attack them. This pest has on no consideration to be allowed to get a hold on the plants; it must at all events be got rid of before they are in bloom because fumigation with tobacco will ruin the flowers.

Cuttings of pelargoniums will root freely now; when rooted they should be potted into small pots, singly, where they may be allowed to remain until they have filled the pots with roots, then they may be repotted into a size two or three inches larger. D. M.

A Pleasant Occasion.

Thursday, August 8 was a gala day at the nursery of the Metairie Ridge Nursery Company, Ltd.; it being the birthday of Harry Papworth, the popular president and the employees had gotten together and presented him with a fine silver mounted umbrella with the following inscription: "Presented to Mr. Harry Papworth, August 8, 1907, by his employees."

E. Baker, having kindly consented to make the presentation for the employees, spoke very highly of Mr. Papworth as a kind employer; and the men appreciating his kindness were ever ready to do what they possibly could for the benefit of the nursery. After the presentation a toast was drunk for the health, wealth and happiness of Mr. Papworth and then a new "Old Glory" was unfurled on a 60 foot pole and when unfurled 44 roses dropped out of the bunting and 44 cannon crackers were fired indicating the age of Mr. Papworth; after which all retired to the new large potting shed where a bountiful supply of edibles, refreshments and cigars were laid. Several of the prominent florists visited during the day.

News Notes.

At a recent meeting of the Board of Commissioners of the lower city park, all bids for the new greenhouse which had been sent in in response to an invitation for same, were rejected, as they were found to be excessive, and Julius Kock, the architect, a member of the board, was instructed to have the work done by sub-contractors and to superintend same. By so doing it is expected to make quite a saving of the funds of the park.

This city will not send as large a contingent to the S. A. F. convention as in other years; up to the present those who have stated their intention of attending are U. J. Virgin and wife, Wm. Behm, Harry Papworth and Chas. Ehle.

Matthew Cook and Miss Carrie Cook have just returned from their trip to Europe; both admit having had a fine time and if looks go for anything they evidently did.

Mrs. John Ehlen and Master Eugene Ehlen are spending a couple of months in New York, with friends.

Otto Abele is improving in health, but rather slowly.

Charles Ehle will take to the S. A. F. convention a plant of his new nephrolepis, a sport from Anna Foster. The pinnae are so minutely divided that the limit is undoubtedly reached. This fern is to the nephrolepis what Adiantum gracillimum is to the maidenhair family. The stock at present is rather limited, and it will be several years before it can be placed upon the market; when it is, there is no doubt but that it will be grown extensively for cutting for the finer class of floral work, as there is no nephrolepis, the fronds of which have such a light spray-like appearance. In fact, the whole plant has a fluffiness which gives it an almost indescribable charm. Mr. Ehle is to be congratulated upon being the fortunate possessor of this fine representative of the nephrolepis family.

NATIONAL PLANT CO., Dayton, O.

What are you seeking, brothers mine? Is it to learn where plants are fine? Look at my Araucarias fair— We searched the world to bring them here. **Excelsa glauca**, look at these. They make you think of those strange trees That grew in Eden long ago, With perfect form and lustrous glow. Of Nephrolepis I've a lot. Boston Whitman and Scott; Elegantissima and Barrowsi 'tis as well, 1 of this beauty need not tell; Fronds green like grass when Spring is here, As bridal veils o'er faces dear. Plants in general we grow Of perfect shape; before all they bow. Our palms with healthy, glossy leaves— Come see them all. I am the chief. Warmly I hope that while you are here, Each hour may yield a pleasure dear.

1907 is the twelfth anniversary of our very successful career in the importation, growing and shipping of that well-known and much admired evergreen decorative plant, the **Araucaria Excelsa**, **Compakta**, **Robusta** and the **Glauca**. Now is your chance and the time to fill your empty houses and make money fast, as the plants will grow into money while you sleep.

ARAUCARIA Excelsa, 5 in. pots, 10-12 in. high, 3 tiers, 2 years old, 50c. each; larger sizes, 5-6½ and 6 in. pots, 2-3-4 years old, 60c.-75c.-\$1.00 to \$1.25 each.

ARAUCARIA Compakta Robusta, 6 in. pots, 2-3-4 years old, 10-12-15 to 18 inches high, 3 to 4 tiers, \$1.00-\$1.25-\$1.50-\$1.75 to \$2.00 each.

ARAUCARIA Glauca, 3-4-5 tiers, 2-3-4 years old, 10-12-15-18 to 20 in. high, 6 in. pots, \$1.00-\$1.25-\$1.50-\$1.75 to \$2.00 each. Specimen plants, **Compakta Robusta**, of last year, Spring, 1906 importation, 6 years old, 30 in. high, 7 in. pots, (something fine), 5 tiers (perfect), \$2.50 to \$3.00 each.

Please state if plants are to be shipped with or without the pots.

Cash with order please.

PETER HENDERSON & COMPANY

35 & 37 Cortlandt St., NEW YORK

Newport, R. I.

News and Trade Notes.

Not so many years ago the late J. M. Hodgson was not only the leading florist and decorator in Newport, but he was also one of the most prominent florists in the city of New York. In Newport he was considered a successful investor in real estate besides, and for many years the properties he held seemed to be paying him well. Things are changed now. One of the properties most highly thought of by the original head of this firm, because there was in connection therewith a large tract of land, which he converted into a nursery and garden for Summer bloom, is now offered for sale in small lots to suit purchasers at prices that would appear ridiculously low to the man who hoped for so much from this property, when he had Mrs. Ladenburg, widow of the millionaire Long Island begonia grower, several Summers as a tenant.

Gibson Brothers have moved away from the Avenue; and F. L. Ziegler, who formerly did business in a little store on Broadway, is now located in a light-toned store on the Avenue and doing fairly well. The Faddens have disappeared entirely; crockery is now sold where for two generations the cream of society purchased cut flowers.

The anticipated rush of business did not materialize quite up to expectations last week; there were quite a number of small decorations, but only one that amounted to a great deal and that one was given by Mrs. Stuyvesant Fish at Crossways. It was done by Wadley & Smythe and consisted almost entirely of pink Rambler roses, constructed into miniature arches on the dinner tables. Pink is the favorite color here so far, and Rambler roses of that color lend themselves admirably to the work in hand.

I see by The Florists' Exchange that Messrs. Julius Roehrs Company have registered pink Rambler rose "Newport Fairy." They had another name for that rose, but changed their minds and went back to the name the raiser gave it when it was exhibited here in Newport and awarded a silver medal which it

Permanent Homes for Florists' Clubs, Etc.

When one considers the constituency of the large majority, if not all, of the florists' and gardeners' clubs throughout the country, the meagerness of the incomes of these organizations, the good use to which they have put their funds in the giving of exhibitions and otherwise, the ridiculous statement that the older ones now at this stage of their existence might, "with a little more selfreliance and farsseeing judgment," be in "possession of a remunerative property. * * * furnishing a permanent home," etc., vouchsafed by our Boston contemporary, at once becomes obvious. The case of the Massachusetts Horticultural Society, in this respect, cannot be held up as an example; that body is composed largely of wealthy members, has received several munificent endowments, and in nearly every other regard is different from the florists' and gardeners' clubs, whose membership is drawn from the men with whom every dollar counts; but who, nevertheless, have acted well their part in the promotion of horticulture.

But why did our contemporary not include the S. A. F. O. U. in its "wise behind hand" preachment? That society is also of "respectable age," and is yet homeless, much, as we think, to its disadvantage.

It is a far simpler matter, evidently, to secure funds for many other purposes than it is to collect money for the purchase of property for permanent homes for florists' clubs; and the fact that old organizations are still without these necessary adjuncts is not because the members lacked judgment and foresight, but because the opportunity was and is wanting. And in this respect they are not alone among wealthier institutions of a character similar to their own, as witness the many bodies, fraternal and others, which assemble in rented meeting rooms.

If, however, our contemporary has discovered an easy way of securing funds for the building of permanent homes for our clubs, we feel sure these bodies will welcome the intelligence; or, in common parlance, to be "put wise," thereabout.

UNIFORM NOMENCLATURE.—Writing in the National Nurseryman on this subject, James MacPherson recommends the adoption of the nomenclature used in the various "Kew Guides," by American catalogue makers and others, with a view to bringing about uniformity in plant names. He says "neither Nicholson nor Bailey can be relied upon for standard names."

BOOKS RECEIVED.

PLANT BREEDING, by Dr. Hugo DeVries, Professor of Botany in the University of Amsterdam. Publishers, The Open Court Publishing Company, Chicago.

In this work, which is largely a reproduction of lectures delivered by Dr. DeVries at the universities of California and Chicago during the Summer of 1906 and of addresses before various audiences during his visit to the United States on that occasion, he has reviewed in a general way his theory of the origin of species and varieties by mutation, and also provides in full, and published for the first time in English, the discovery of the elementary species of agricultural plants by Hjalmar Nilsson; a chapter on corn breeding; a comprehensive account of the production of horticultural novelties by Luther Burbank; a chapter on the association of characters in plant breeding and another on the geographical distribution of plants.

It appears from the chapter dealing with the work of Professor Nilsson at the Agricultural Experiment Station of Sweden, at Svalof, that the first to discover the principle of improving cereals by selection was the English breeder, Le Couteur. He lived in the first part of the last century on Jersey, one of the islands in the Channel, off the coast of France. On the sugges-

the Scottish agriculturist, Patrick Shirreff. He lived about the middle of the nineteenth century and had his farm at Haddington in East Lothian, Scotland. He observed that from time to time, and as he thought by mere accident, a plant occurred which seemed far more promising than all the remainder in the same field. Such individuals he marked, helping their development by pulling out their neighbors if they were crowded and surrounded them by all manner of attention. Then he saved their seeds separately and sowed them in order to multiply his new types as fast as possible. His first discovery was made in the year 1819. He observed a plant of wheat which surpassed its neighbors by its high branching. He saved the seeds, sowed them in a separate field and at considerable distances apart, so as to induce in all the plants the same rich branching. He contrived to multiply it so rapidly that it took only two generations to get seed enough to bring it advantageously into the trade. Shirreff had no idea of the necessity or even of the usefulness of a repeated selection. On this point he wholly agreed with Le Couteur. Without exercising any choice, he sowed all the grains of his selected plants and of their progeny, his only aim being to multiply the new form as quickly as possible. They yielded a uniform race, and were simply expected to do so.

Le Couteur and Patrick Shirreff seem to be the only breeders of cereals who have worked on the principle of one single initial selection and of subsequent rapid multiplication without renewal of the choice and without isolating the best individuals during the following generations. On this point they are to be considered the precursors of the method which has of late been discovered by Professor Nilsson.

Another renowned breeder of cereals was F. F. Hallett of Brighton, England, who began his work in the year 1857. His principle was that each plant has one head which is the best of all its ears, and that in the same way each ear has one best kernel. Moreover, he was convinced that the best kernel of the whole plant is always to be found in the best ear. He also assumed that the qualities of the single kernels are inherited by the plants which they produce. From these premises he concluded that varieties could be improved by choosing the best kernel of the best ear for their reproduction. This choice had to be repeated through a series of generations, but his experience taught him that though the gain was large in the beginning, it did not continue so, but soon reached a limit which it was practically impossible to transgress. Hallett gave the name of pedigree-culture to his method of selection, its essential feature being the repeated selection.

The results of the experiments of Professor Nilsson confirm the fact that the ordinary cultivated varieties of cereals are by no means pure, but must be considered as mixtures of well defined types. They also show that these types are far more numerous than was previously supposed, and include hundreds of forms within each of the now prevailing sorts. They likewise show that the differences among these newly discovered elementary types are far greater than might be suspected from the study of the varieties isolated by other breeders. The range of variability disclosed by these new studies is simply so wide that it affords all the required material for almost all the selections desirable at present, and will no doubt continue to be an inexhaustible source of improvements for a long succession of years. They are founded on the principle of single selection, and the range of application of this method is proven to be so extensive as to make all idea of repeated or continuous selection simply superfluous. It is even so rich in its productiveness that there is scarcely any room left for other methods of improvement; and especially should all endeavors of winning ameliorated varieties of cereals by means of hybridization simply be left out of consideration, as compared with the immense number of more easily produced novelties which this method offers.

The experiments at the Swedish Agricultural Experiment Station are gone into very fully by Dr. DeVries, and criticism on the principle of continuous selection is made. The remarks by Dr. DeVries on corn breeding will be found of immense interest to those engaged in this class of work. As we have stated, the work of Luther Burbank is very fully treated upon by Dr. DeVries. He refers to the advantage to be derived from the grant to Mr. Burbank by the Carnegie Institution of Washington of \$10,000 for ten years, the recording of the history of his experiments, and thus creating a source of practical and scientific information of the highest importance upon many questions of plant breeding. Such a standard work is the more needed, since the methods and results of European horticulturists are, as a rule, accessible to American breeders only with difficulty. He further states that Burbank has had to re-discover many of the rules and practices which in Europe were more or less universally known. Burbank's science and methods are his own work, although in comparison with those of other horticulturists they do not contain essentially different procedures.

Professor Hugo DeVries.

Courtesy Open Court Publishing Co.

tion of Professor La Gasca of the University of Madrid, who pointed out to him some 23 different forms growing in a field of wheat, Le Couteur saved the ears of the indicated types separately, and sowed their grains in small field plots in order to compare their productivity. He does not seem to have had any theoretical view concerning the causes or the nature of the observed differences, but simply assumed that the progeny of his selected plants would be like the parents. On this point he soon found himself justified by the results of his experiments. He had produced a group of new types of which some proved better and others less valuable than the ordinary sorts of his fields. The best new varieties, isolated in this way, he then multiplied, and afterwards put them upon the market. One of them is still grown in England and the Northern parts of France on a tolerably large scale. It is a kind of wheat called "Bellevue de Talavera" and it is known to be a very pure and uniform type. It is so uniform that it does not afford any deviation by which it can be subjected to further selection, and all trials in this direction have been in vain.

Another celebrated breeder who worked on the same principle though after a somewhat different method, was

The importance of a knowledge of agricultural plant breeding is the evolving of useful qualities, says the author. But what are qualities and how may they be discerned and studied? For many years this question has been considered as a very simple one, easily to be answered on the basis of our common knowledge. Of late, however, this attitude has completely changed, and the intimate nature of qualities and characters has become an object of most intense interest for the practical breeder as well as for the student of evolution. Experience has taught that qualities are often associated with one another by distinct laws, and that a knowledge of these laws may give us a power over them, greater than any man has heretofore aspired to. Even a suspicion of the meaning of these laws, or an intuitive appreciation of their work, may lead to valuable results, if it is only combined with a thorough knowledge of the species in question.

Several instances of correlations are furnished by the author. He says it is a common experience that color varieties of plants may be distinguished by their seeds. This rule holds good for garden plants as well as for large crops. A dark color of the seed indicates a bright flower, a pale seed is usually associated with white or pale corollas. Berries often show the same correlation to the flowers. If a species has red or blue corollas combined with dark berries, its white variety will often show pale or even white fruits. Perennial herbs may show the same correlation. In the colored forms the young shoots which arise from the root stocks have a dark tinge, but in the white varieties they are pale or colorless. Bulbs of hyacinths may seem to the layman to be all alike, but the breeder is often able to distinguish their varieties by their size, the number of their little side bulbs, the form of their top, and especially the color of their outer coats. The correlation between the marks of the dry and marketable bulbs and the characters of the flowers is so highly developed that the Dutch bulb grower Voorhelm is said to have been able to distinguish more than a thousand varieties of hyacinths solely by inspecting their bulbs.

All in all, the study of these correlations is of the highest interest, as well for science as for practice. By means of them we may predict one quality or one function from the study of others. Insignificant characters or organs may show us the way and guide us in our selection. The more we familiarize ourselves with such seemingly subordinate marks, and with their relation to the qualities, which determine the commercial worth of the plant or of the harvest, the better we shall be prepared for the work of selection.

The book, which is a valuable and instructive one, is profusely illustrated and the binding and typographical work are all of the usual standard of excellence turned out by the Open Court Publishing Company. A very full index adds to the value of the volume, copies of which can be obtained through the publishers of *The Florists' Exchange*.

The Late John C. Teas.

John C. Teas, who passed quietly away on July 29, 1907, at his home near Carthage, Mo., was well known among the veteran nurserymen of the country, especially those of a generation now almost past. He was the originator of the weeping mulberry which bears his name, and in his earlier years he was intimately associated with Charles Downing, John J. Thomas, Dr. John A. Warder, Andrew S. Fuller, and many other prominent workers for the advancement of horticulture, and in many of their works his name is given as having assisted in their preparation.

He was born in Indiana in 1827, and began his life-work in childhood, his first achievement being a bed of *Sanguinaria canadensis* and a plant of white clover. His early school days were spent in a log schoolhouse in the "big woods" of the Hoosier State; and his first trees were small seedlings collected in an orchard through which he passed on returning from school, and carried home in his dinner pail. The lack of advantages in those early days was not the only obstacle to be overcome by a young man whose ambition was horticulture. The wise ones were free to give the advice that when the trees already planted should come into bearing, the fruit could not be consumed or sold—and, of course, people would not buy and plant more trees. And as the best apples could hardly be sold at 10c. a bushel, and trees of the best sorts were 3c. to 5c., the outlook was not encouraging. Nothing daunted by opposition and discouragement, the boy went on with his chosen work. In 1850 he went to Rochester, N. Y., and worked for Ellwanger & Barry, to learn more of the business. He had to go 100 miles to the nearest railroad station, on foot and by the old stage coach, then a ride on the cars, and across Lake Erie on a steamboat.

He conducted one of the most extensive nurseries and greenhouses in Indiana until 1869 when he moved to Carthage, Mo., where he continued the business up to the time of his last illness. He brought from Indiana a very extensive collection of the choicest varieties of both fruits and ornamentals, which have since been largely distributed into every State and territory of the Union, as well as to many foreign lands.

Until about 1878 there was utter confusion and uncertainty among tree men in regard to the different kinds of catalpa trees. With the assistance of the late E. E. Barney, Mr. Teas carefully examined these trees over a large area of territory where they grow, devoting several years to the work and traveling many thousands of miles. In this way he discovered and made known the native habitat of the "hardy Western" catalpa which was named "speciosa" by Dr. Warder, and Mr. Teas was the first to publish that name and send out trees under it. He also originated and disseminated the well

The Late John C. Teas.

known Teas' Japan hybrid catalpa, noted for its rapid growth and large panicles of flowers.

He was one of the founders and charter members of the Indiana State Horticultural Society, and was made an honorary member when he left the State.

To his skill, energy, and life-long devotion to the profession are due many important additions in trees, fruits and flowers, most notable among which are the weeping mulberry, Japan hybrid catalpa, and his last introduction, Teas' white flowering red bud, or Judas tree (*Cercis canadensis alba*), which he regarded as one of the most important additions in recent years to the list of hardy ornamental trees, and of which he had propagated a large stock.

He leaves a widow and two daughters at the old homestead, two sons—W. C. Teas of Chattanooga, Tenn., and Edward Teas of Joplin, Mo.; two brothers—E. Y. Teas of Centerville, Ind., and T. S. Teas of Salem, O.

OUR READERS' VIEWS

Seedling Peonies.

Editor *Florists' Exchange*:

Some of our leading growers are inclined to discourage the raising of new sorts, contending that it is much better to procure those of acknowledged merit and propagate them. This can, and should be done. But what is to hinder saving seeds from these very best and planting them? Why should we go to Europe for everything? There are possibilities lurking in the seed of such peonies as Lemoine and Dessert send out which should not be overlooked.

Again, but little attention has been paid to this work in America, yet what efforts have been made have been crowned with cheering success. What collection is complete without some of the American sorts—those of Richardson, Rosenfield, Terry and Hollis? I paid Hollis \$10 for one root of Loveliness, and it was the best flower we had on our place this year. It was charming in beauty, fragrant as a rose, with a strong stem, a fine keeper and passed away gracefully. We are not to despise the work of these men.

I have a friend who is a great lover of flowers. A few years ago he secured some fine peonies. He planted the seeds. When one plant was only three years old it bloomed profusely. This year, which was the fourth from seed, it was covered with flowers. The form of the flower and the delicious fragrance were much like those of Loveliness mentioned. It surpassed in excellence nineteen-twentieths of our imported ones. The question came up, What shall we name it? Here a difficulty comes in. We must not duplicate the 3,000 names already used. Why not name it after your son? a noble young man who had recently died. And then the father, mother and myself christened the lovely flower Louis Bruning, and so that plant, which has a future, will perpetuate a loved name.

I am gathering the best peonies the world affords and nothing will prevent me planting the seeds to see what they will produce. I presume I have 25,000 now on the way. Hundreds have bloomed. I do not see any yet, save three or four, of merit enough to name them.

I suppose there are now at least a million seedlings on the way. Among these there will be but a few that should be named. What shall we do with the rest? Did you ever see a poor peony? There are good, better and best. Save for naming only the choicest. Don't trust your own judgment. I know a woman whose children never can do any wrong; they are just perfect in her eyes. A thing may not be absolutely without blemish because you own it. Don't be in a hurry.

Seedlings will wobble somewhat at first till fully established; even the form and color will change. A promising seedling will have a splendid flower one year; you have great hopes of it, and you may have to wait three years for another bloom. Don't register a flower until it scores the following five points of excellence:

1. It must be of exceptional beauty and fragrant.
2. It must be a good keeper and have a strong stem.
3. It must not be of the sensitive tribe—nipped in the bud by untimely frosts.
4. It must be an annual and not an intermittent bloomer.
5. It must be a ready propagator.

Some very fine flowers will fall down before these tests. We give a good deal of time and space to those which will show themselves only once in three or four years.

The question comes. What shall we do with the thousands of rejected ones? Well, you can throw the poorest of them over the fence. The great bulk of them can be sold to be planted in masses. Some people have a horror of mixed colors, and some don't. To many of us an acre of mixed phloxes or peonies will have a strong attraction. I have thousands of phlox seedlings now in bloom which are my delight. Perhaps not one in a thousand would be worthy of a name, but in a mass they are radiantly beautiful. Those who saw Thurlow's large beds of peony seedlings were delighted, and among them there were at least one hundred equal to many imported ones.

There are thousands of places all over the East which might be glorified by planting these seedling peonies in great masses, just as God plants his wild flowers. While in bloom they would be a vast carpet—brilliant and fascinating in loveliness. Then there is the great Northwest to be filled up with these radiant flowers, and they fit all this region as the rose does California, and the magnolia and jasmine do the South.

Many people have been careless, planting seeds from inferior flowers. Save seeds only from the very best. Plant just as they begin to turn brown, and many will come up the next Spring. If you wait until they are dry, there is no known process by which you can hurry them up. They will take their time. Most of them come up in two years, but some of them will wait three and four years. Plant them where you want them to grow. I have put mine in moist sand till Fall, and then found so many of them sprouted with long roots, that it was fatal to move them. They come up early in the Spring and seem to enjoy the slush and snow and freezing and thawing.

This is delightful work. Men, women and children are engaging in it. The large growers don't have to buy these seedlings. They can import their stock, if they wish, and run the risk of bringing over that fungoid disease which makes the root gnarled, knotted and uncanny, like a gouty foot, or a hand with fingers distorted by rheumatism.

York, Neb.

C. S. HARRISON.

A WONDERFUL NEW NEPHROLEPIS

NEPHROLEPIS SUPERBISSIMA

WE SHALL exhibit at the CONVENTION at PHILADELPHIA some fine specimen plants of this new fern which is a very unique and distinct novelty—as distinct from *Nephrolepis Piersoni* and *Piersoni elegantissima* as they were from *Bostoniensis*.

It is a complete break. The fronds are very heavily imbricated, the pinnae overlapping, making the fronds very dense and compact. It differs from the other *Nephrolepis*, not only in form, but in color also, being a richer and darker green—entirely different from the yellowish green of all the other *Nephrolepis*.

The plant is very sturdy in its habit, the fronds never breaking down. While a photograph shows a similarity to its predecessors, it is absolutely distinct, not only in the formation of the fronds, but in its habit and general characteristics. It makes a much more dwarf and compact growth, the fronds being very dense, firm and rigid, and having a great deal more substance, so it will stand more knocking around than any other fern of this type.

THIS IS A STERLING NOVELTY. Experts who have seen it consider it far and away the best fern ever sent out. It is a plant that needs to be seen to have its great value and sterling qualities appreciated. It really is not in the same class with other varieties.

It will be disseminated by us in 1908. Orders will be booked at once and filled in rotation as booked.

F. R. PIERSON CO., Tarrytown-on-Hudson, N. Y.

Society of American Florists

YOU ARE INVITED to visit us during Convention week, any day at your convenience.

ANDORRA presents a unique Nursery—six hundred acres of hilly land, containing over three hundred and fifty acres of **Ornamental Trees, Shrubs, Vines and Perennials.** Our **Location** permits us to grow many varieties both in deciduous and evergreen trees and shrubs that cannot be grown to advantage North or South of this latitude, and thus adds to our extensive collection many desirable and decorative plants.

ANDORRA has been called **The Modern Landscape Nursery.** The lay-out of our land, with its hills, valleys and woodland, permits the planting of trees and shrubs in natural positions, thus affording planting suggestions at every turn.

ANDORRA is easily and quickly reached from the Convention (Horticultural) Hall by the Pennsylvania Railroad from Broad St. Station (at Broad and Market Sts.) to Chestnut Hill Station; then by trolley, which passes the depot, to the City Line. Our office is one block from the trolley terminus at City Line.

REMEMBER, this is a personal invitation to **YOU.**

SOCIETY OF AMERICAN FLORISTS and ORNAMENTAL HORTICULTURISTS

Incorporated by Special Act of Congress

Charter Signed by William McKinley,
President of the United States, March 4, 1901

The Liberty Bell

TWENTY-THIRD ANNUAL MEETING AND EXHIBITION

To be Held at
PHILADELPHIA, PA.,
AUGUST 20, 21, 22, 23 and 24, 1907

Officers of the S. A. F. for 1907.

President, Wm. J. Stewart, 11 Hamilton Place, Boston, Mass.; vice-president, John Westcott, Ridge and Lehigh Avenues, Philadelphia Pa.; secretary, P. J. Hauswirth, 232 Michigan Avenue, Chicago, Ill.; treasurer, H. B. Beatty, Farmers Bank Building, Pittsburg, Pa.

Directors for one year, E. V. Hallock, Queens, N. Y.; W. H. Elliott, Brighton, Mass.

For two years, F. H. Traendly, New York City, N. Y.; Theodore Wirth, Minneapolis Minn.

For three years, Samuel Murray, Kansas City, Mo.; J. K. M. L. Farquhar, Boston, Mass.

Botanist, Prof. L. H. Pammel, Ames, Iowa.

Pathologist, Dr. B. M. Duggar, Columbia, Mo.

Entomologist, A. H. Kirkland, Beacon Building, Boston, Mass.

Superintendent of Exhibition, David Rust, Horticultural Hall, Broad and Locust Streets, Philadelphia, Pa. Plant Registration in charge of secretary.

Legislative Committee, Benjamin Hammond, Fishkill-on-Hudson, N. Y.; L. B. Coddington, Murray Hill, N. J.; Wesley Greene, Des Moines, Ia.; E. A. Mosley, Washington, D. C.; Patrick Welch, Boston, Mass.

Committee on Convention Sports, William Graham, Philadelphia, Pa.; A. B. Cartledge, Philadelphia, Pa.; J. J. Beneke, St. Louis, Mo.

Officers of Philadelphia Florists' Club.

President, S. S. Pennoek; vice-president, Fred. Hahman; secretary, David Rust; treasurer, J. William Colflesh.

Chairmen of Convention Committees.

Exhibits David Rust, Horticultural Hall
Reception S. S. Skidelsky, 824 N. 24th street
Hotels Joseph Heacock, Wyncote, Pa.
Entertainment Fred. Hahman, Harrowgate Lane
Finance C. D. Ball, 3400 Rhawn street
Ladies C. D. Ball, 3400 Rhawn street
Bowling Wm. Graham, 104 So. 13th street
Shooting A. B. Cartledge, 1514 Chestnut street

THE members of the Society of American Florists are by no means strangers to the city where the present year's meeting and exhibition of the organization are to be held. Twice before have the craft in Philadelphia had the honor, as well as the pleasure, of being the hosts of the national association—in 1886, when the sessions were presided over by John Thorpe; and again, in 1894, at Atlantic City, N. J., when the late J. T. Anthony, Chicago, was president. Each of these noted gatherings is still a most pleasant memory, for there are few occasions on which the S. A. F. has been more royally entertained or better taken care of than when it was the guest of the men and women of the City of Brotherly Love.

It is worthy of note as well that the national society has no more loyal adherents in its ranks than the Philadelphia members. The membership from that city and district has at all times been a large one, and one that, no matter where the annual gathering was held, near or far, always turned out strong, and, best of all, when present always took an active part in the proceedings. Prominent in debate, helpful by advice and counsel in all that makes for the welfare of the association and of the varied interests it advances, the Philadelphia contingent have acted well their part in the society's social and intellectual development, and stand out boldly as faithful, unselfish representatives of the highest type in society affiliation, and all that it implies.

It was but natural, therefore, that from among these men the S. A. F. should seek and find some of its leaders. Three times has the presidential chair been filled by a Philadelphian—Robert Craig, in 1887; Edwin Lonsdale, in 1895, and John Burton in 1902 and 1903. Mr Lonsdale also acted as secretary of the society for one year—in 1887.

The meeting and exhibition this year promise to be record-breakers. The sessions will be presided over by William J. Stewart of Boston, who was the secretary of the society for over twenty years, one to whom its varied requirements, its past successes and

William J. Stewart,
President S. A. F. O. H., 1907.

future field of operations are probably better known than to any other of its members. On that account

we look forward to an interesting, instructive, as well as a suggestive address from President Stewart.

The society in the past few years has devoted much attention to the development of general gardening, thus tending to create a greater interest by the trade and the public in the products of the greenhouse and nursery suitable for outdoor planting. The preliminary program for the Philadelphia convention shows that this phase of the society's endeavor is to be well cared for; in fact, so much so, that unless the Question Box develops inquiries on matters concerning the management of plants in greenhouses, the latter branch of the business will be entirely ignored this year at the convention.

Other topics that will come up for consideration are those of horticultural education in common schools, agricultural schools and by horticultural societies. These subjects are to be handled by practical craftsmen, the latter phase—horticultural education by horticultural societies—being a review of work of this nature now in actual operation and relating to the recently formed Boston Landscape Class.

We are in thorough accord with this line of work being taken up and discussed by the S. A. F. O. H. It is true, such discussion can benefit the membership of the society but little in a direct way; yet indirectly the result should be highly advantageous to the trade. Horticultural education now forms a part of the curricula of several of our schools and colleges; the field is an extensive one, but the practical teachers are as yet limited in number. And if the essayists on the present occasion but show the defects and drawbacks of the present systems, and point the way to better and more successful achievements in work of this kind, they will have accomplished much. It is to be hoped that their thoughts and ideas on the matter, as printed, will fall into the hands of those who will profit the most by their promulgation.

The proposed National Flower Show is again to be a subject of discussion by the delegates. It is understood that the guarantee fund of \$10,000, the raising of which was considered essential before attempting

this undertaking, has been subscribed. That being the case, there should be only one decision concerning this show—that it be held. There are many reasons for this, not the least being the prestige an exhibition of this kind will lend to the national organization, tending toward its greater stability, progress and usefulness. Introducers and originators of new plants in America will benefit by the society's seal of approval on their novelties, and the trade and the plant-buying public will profit by the knowledge that such recognition has been withheld, should that be the judges' verdict. Those of the trade who have traveled in Europe tell us of the high value placed upon the awards of the S. A. F. O. H. in other countries; these awards are equally appraised here. More opportunities should be afforded for their bestowal. We should therefore have as many national flower shows, or exhibitions under the auspices of the S. A. F. O. H., as possible; the larger the number, the better for the trade and for the society itself. In any event, there should be a unanimous vote at Philadelphia in the case of the proposed initial venture along this line in 1908. Its many merits have already been well stated by those most interested; its drawbacks, if any, have yet to be disclosed.

It is reported that a committee has been appointed by the president to consider the advisability of changing the present name of the organization to that of "The Society of American Horticulture," the object of the change being, it is said, to bring about "a broader and more comprehensive title." The designation proposed is but slightly different from that suggested by the late Grove P. Rawson at the Cleveland (O.) convention in 1896 (see report for that year), namely, "An American Society of Horticulture," which title met with considerable opposition being finally voted down. The reasons given for the non-adoption of the Rawson name are as valid and vital today as they were then; and unless some more convincing arguments are adduced, than those then submitted, in favor of the adoption of the name now proposed, we fear it will share a fate similar to that of its predecessor.

Phil. J. Hauswirth,
Secretary S. A. F. O. H.

The original title—The Society of American Florists—has a warm place in the affection of the large majority of the membership; and it was solely owing to the averment that, by the addition to it of the words "Ornamental Horticulturists,"—indicrous though the term be and never particularly popular—the chances of securing a national charter for the society would be better than without that addition, that the appendage was agreed to. The amended title served its purpose; the charter

John Westcott,
Vice-President S. A. F. O. H.

was obtained under it. Now it is proposed to sink the original name, (as well as the chartered one) into oblivion, thus removing entirely a designation that aptly applies to the major portion of the membership of the organization, and one under which its best work so far has been achieved.

Personally, we can see no great advantage in the proposed change. It is not so much the title of a society that commands success in every particular as the men behind the name and the work accomplished through them; and continual alteration of a title is not by any means, in our opinion, conducive to progress being also indicative of weakness.

The society can do just as much under its original name, and be as properly recognized therefor, as it can under any other; its doors are wide open to all interested so far as membership is concerned, and no sensible man will balk at that name so long as the efforts of the association are in accord with his views of its aims, objects and performances. If the society falls short in any respect in the accomplishment of these, it is the duty of one and all to point out its shortcomings so that the proper remedy may be forthcoming.

If any change of name is necessary, let it be a return to the original title—a name honored, revered and respected by those engaged in horticulture not only in America, but throughout the rest of the civilized world, both for the good the society bearing it has done and for the intellectual and business caliber of the men composing the "good old S. A. F."

The preliminary program also shows that the social end of the coming convention is to be well looked after. This was a foregone conclusion, and is, as we have said, but characteristic of the craft in the City of Brotherly Love. And the greater the number of delegates that are present to partake of their well-known hospitality, the better they will like it.

The Trade Exhibition.

The trade exhibition will be located in Horticultural Hall, corner Broad and Locust streets. Growers of plants, seeds, bulbs, shrubs, and trees, dealers in florists' supplies, greenhouse requisites, building material for greenhouse construction, heating apparatus, etc., can here meet the best buyers in the horticultural profession.

N. B. Exhibitors are reminded that the duties of the judges are limited to the consideration of exhibits and to the making of awards to novelties and improved devices only. Exhibitors are required to make previous entry of all such exhibits with the superintendent in writing. Full rules and regulations, together with diagrams of the exhibition hall, may be obtained from David Rust, Horticultural Hall, Broad and Locust streets, Philadelphia, Pa., Superintendent, to whom all applications for space should be made as early as possible.

The Convention City in 1907

Students of American history, which term, of course, comprises all loyal citizens of the country, including those whom we now address, are familiar with the story of the early days of Philadelphia, and the noble part played by the denizens thereof in the formative period of our great and glorious Republic. It is therefore needless to do more than briefly touch upon some of the most salient and enduring points in the city's history.

According to authorities, probably the first European to tread the soil which now belongs to the City of Philadelphia was a certain Captain Hendrickson, who commanded one of the five vessels fitted out by the Dutch West India Company in the year 1623. Previous to that date, however, Henry Hudson, the English navigator, had entered the rivers on which the city now stands. The Swedes, who also sent out expeditions about the same time as the Dutch, may be considered the first permanent settlers, as neither the Dutch nor the English had up to that time been very successful in establishing their expeditions on this portion of the American coast line.

In 1674, by a treaty between England and Holland, the settlements of the latter country in America were ceded to Great Britain. William Penn having become somewhat acquainted with the character of the country, he being then part proprietor of West Jersey, on the opposite shore, sought larger possessions; and the British Government being indebted to his father, Admiral William Penn, in actual money as well as for services rendered, the young Quaker found but little difficulty in obtaining a grant for a large tract upon which to found a colony. The charter of the Province of Pennsylvania was granted at Westminster (London), on the 4th of March, 1681 (old style). The City of Philadelphia was chartered by Penn in 1701; in 1854 many adjoining towns were consolidated with it, and in 1887 the present municipal government was instituted under the provisions of the Bullitt Bill.

Penn had determined that the capital of the new province should be called Philadelphia. When the name was first given is not known. It is found in a warrant for land, executed the tenth of the fifth month

H. B. Beatty,
Treasurer S. A. F. O. H.

of 1682. The name, which is derived from the two Greek words, *Philos Adelfos*, signifying "brotherly love," is supposed to have been adopted from that of a city in Lydia, Asia Minor, the site of one of the seven early churches. The name "Quaker City," was applied on account of the dominant religion of the original settlers.

The history of the naming of Pennsylvania may also be of interest. "This day," writes Penn, on January 5,

1681, "my country was confirmed to me by the name of Pennsylvania, a name the king (Charles II.) would give it in honor of my father. I chose New Wales, being as this is a pretty, hilly country. I proposed (when the secretary, a Welshman, refused to have it called New Wales) Sylvania, and they added Penn to it, and although I much opposed it, and went to the king to have it struck out and altered, he said he would take the responsibility upon himself. . . . I feared lest it should be looked upon as a vanity in me, and not as a respect of the king, as it truly was, to my father."

The plans for the original city were laid out with the assistance of Thomas Fairman, an English surveyor, in December, 1681.

Philadelphia, in size, is now the third city in the United States. It covers an area of 129.58 square miles. Architecturally and otherwise it compares favorably with any of the other large cities in the country.

The following enumeration gives the city's points of interest, as well as an epitome of the historical facts associated with many of the buildings and institutions named:

Philadelphia's Points of Interest.

INDEPENDENCE HALL.—Chestnut street, between Fifth and Sixth streets. Erected 1729-1735. Second Continental Congress was convened here, and on July

Independence Hall, Chestnut Street Front, Philadelphia.

4, 1776, the Declaration of Independence was adopted. Here are many famous portraits and the "Liberty Bell." The latest information concerning the "Liberty Bell" is taken from a recent issue of the *New York Sun*, and is given for what it is worth:

"Contrary to general belief the old Liberty Bell is not the property of the nation or of the City of Philadelphia, but of four sisters who are heirs of John Wilbank, the man who made the new bell shortly after the old one was cracked, and who took the old bell as part payment. According to the *Home Magazine*, three of the sisters, Mrs. James B. McClosky, Mrs. G. D. Emerson and Mrs. S. B. Coward, live in Philadelphia. The fourth, Mrs. S. W. B. Diehl, lives in Washington, D. C.

"By an order of the Assembly of the Province of Pennsylvania the Liberty Bell was cast by an English founder in 1751. Soon after arriving in this country the bell broke, but was recast from the same metal in the same form and with the original inscription, 'Proclaim Liberty Throughout the Land.'

"The ownership passed from Provincial authorities to the State, but in 1818 it was purchased by the City of Philadelphia, together with the old State House and grounds. During the celebration over the arrival of Lafayette in 1824 the bell was rung so vigorously it became cracked, and a few months later was ordered replaced by a new bell cast by John

Broad Street, Philadelphia, Looking North from Locust.

Wilbank. The later bell is hanging in the steeple of Germantown Hall."

CARPENTER'S HALL.—Stands off Chestnut street, between Third and Fourth streets. The first American Congress assembled here September 5, 1774. Open to all visitors.

BETSY ROSS HOUSE.—No. 239 Arch street. Birthplace of the American flag. Open to the public, free.

FRANKLIN'S GRAVE.—Arch street, below Fifth.

CONGRESS HALL.—Where Washington was inaugurated President of the United States, in 1793, for the second time, is at Sixth and Chestnut streets.

WILLIAM PENN'S HOUSE.—Fairmount Park, west of Girard Avenue Bridge. It was built in 1682, and was the first brick house erected in Philadelphia.

FRANKLIN INSTITUTE.—Seventh street, below Market; 9 a. m. to 5 p. m. Founded by Benjamin Franklin.

UNIVERSITY OF PENNSYLVANIA.—Thirty-fourth and Spruce street; 9 a. m. to 5 p. m.

DREXEL INSTITUTION.—Thirty-second and Chestnut streets; 9 a. m. to 5 p. m.

UNITED STATES MINT.—Sixteenth and Spring Garden streets; 9 a. m. to 5 p. m.

COMMERCIAL MUSEUMS.—Thirty-fourth street and Vintage avenue, West Philadelphia. Permanent exhibit of raw products from all countries.

PHILADELPHIA BOURSE.—Between Fourth and Fifth streets, below Market. The first institution of its kind in America. Open from 9 a. m. to 5 p. m.

WASHINGTON MONUMENT.—Green street entrance to Fairmount Park.

HORTICULTURAL HALL.—Fairmount Park.

FAIRMOUNT PARK.—The largest public park in America. There are about 50 miles of drives and 100 miles of walks.

Hotel Walton and Broad Street Theater, Philadelphia.
Headquarters and Meeting Hall, Respectively, of S. A. F. O. U.

Independence Hall, Independence Park Front, Philadelphia.

Horticultural Hall.

The lot on which the present Horticultural Hall stands is 90 feet in front on Broad street and 200 feet deep along Lardner street. On the first floor the front part of the building is devoted to the library of the Horticultural Society and the offices of the secretary. The central part of the building is occupied by the hall of the grand stairway, waiting rooms, lavatories, etc. Ascending the grand stairway one enters the large hall, 70 by 100 feet, with a vaulted ceiling at a height of 35 feet. It is lighted on each side by a series of five large windows; at its west end is the platform.

The room and bowling alleys of the Philadelphia Florists' Club are located in the basement of Horticultural Hall the entrance being on the south side near the front.

The trade exhibit of the S. A. F. O. H. will be held in Horticultural Hall; the meetings in the Broad street theater, directly opposite the hall.

Philadelphia's Horticultural Record

The record of Philadelphia in a horticultural way is an honored, honorable, and interesting one, and in the annals of the craft in America probably stands unequalled. This, too, whether viewed in the light of general or commercial gardening. It is probable that the inhabitants inherited their love of plants and flowers from the early Dutch, Swedish and British settlers, whose interest in horticultural matters is demonstrated by the fact that the principal streets of the city were originally named after trees, such as Chestnut, Walnut, Spruce, Pine, Locust, Cherry, etc. Soon after the establishment of the Province of Pennsylvania William Penn encouraged his Quaker followers to plant English flowers and fruits, and advised them as well to experiment with the fruits indigenous to the New World. It is recorded, too, that George Fox, the founder of the Society of Friends, who died in 1690, and who himself had visited the colonies, took a great interest in the welfare of the settlers, and by his will left sixteen acres of land to be used for various purposes, among which was the allotment of six acres "for the site of a Meeting House and School House and for a Playground for the Children of the Town to play on and for a Garden to plant with Physical Plants for Lads and Lasses to know Simples and to learn to make Oils and Ointments." Doubtless the farseeing Quaker had in view the establishment of an institution similar to the famous "Physick Garden" of Chelsea, England, with the advantages and educational character of which he was no doubt fully acquainted. However, his desires did not then culminate; but the Quaker lads and lasses grew the Simples and cultivated other plants and flowers, and by the time of the Revolution gardening in Philadelphia had reached a very high standard.

Notable among the old colonial gardens in the City of Brotherly Love was the one at Fair Hill, belonging to Isaac Norris, then speaker of the assembly, which was in fine cultivation as early as 1718. This garden was said by Father Pastorius, himself a distinguished *terri-culture* of Germantown, and a great traveler, to have been the finest he ever saw, being "filled with an abundance of rarities, physical and metaphysical," and producing, like his own garden, also "cordial, stomachic and culinary herbs." Of his own garden Pastorius, who was a German, a scholar and a poet, thus speaks:

" * * * What wonder then
That F. D. P. likewise here many hours spends
And, having no money, on usury lends
To's garden and orchard and vineyard such times
Wherein he helps nature, and nature, his rhymes;
Because they produce him both victuals and drink
Both medicine and nosegays, both paper and ink."

Pastorius left behind him a manuscript poem of

Horticultural Hall, Broad Street below Locust, Philadelphia.
Where S. A. F. O. H. Trade Exhibit will be held.

many thousand words on the pleasures of gardening, the description of flowers, and keeping of bees. His poetry having been written in different colored inks he remarks that of "turmeric and elder leaves

"He forms his red and green,
as here is seen."

Isaac Norris had also a very fine garden surrounding his town house, which was located on Fifth street on the site now occupied by the Bank of the United States, to which the same care and attention were given as to the Fair Hill place. Along one side of this city garden was a long lane of remarkably large catalpa trees; and on the Fifth street side was a row of "yellow" willows, "being the first planted in Philadelphia; the whole the product of a wicker basket found sprouting in Dock Creek, taken up and planted in Mr. Norris's garden at the request of Franklin."

Penn himself established for his family at "Springetts-berry," named in honor of his first wife, a garden of considerable importance, presided over by one James Anderson. It was in full operation in 1736. Thither the young Quakers went to pluck posies in May of each year. The honors of the place were latterly done by an old black servant, Virgil Warder, who, in 1777, astonished and gratified the visitors by showing them a wonder in a blooming American aloe, which had been raised in the greenhouse. This garden was famed for its fine collection of trained evergreens which were kept in nice formal shape.

Another noted old-time garden was that of William Hamilton, at the period in which it existed one of the best, containing as it did a large collection of exotics. This garden was in full operation about the close of the eighteenth century, and was broken up in 1828. The owner is said to have, among other things, introduced the Lombardy poplar into America, although this statement has been questioned by some.

Home of John Bartram, Fairmount Park, Philadelphia.

in America—that founded by John Bartram in 1728—of whom fuller particulars are given further on in this article.

In the commercial branch of the business the convention city of this year early took a foremost position. The oldest seed house in the United States had its home here, viz., David Landreth's, founded in 1784, and the business is still operated by his descendants at Bristol, Pa. For many years, in the early days of the trade, the best market for plants, flowers and vegetables was found in Philadelphia, and to that city gardeners from the Old World were first attracted.

When the camellia was at the height of its glory,

the growers of Philadelphia were renowned as cultivators of this then popular plant; in fact, had few, if any, peers in this particular work. Writing in 1895 in Depew's "One Hundred Years of American Commerce," the late Alfred Henderson says: "Fifty years ago, camellia flowers retailed freely for a dollar each, and during the holidays Philadelphia used to send thousands to New York florists, getting \$500 per thousand; while roses went begging at one-tenth these figures." In the cultivation of other classes of stock, particularly palms, Easter and Christmas plants, and American Beauty roses, the Philadelphia craftsmen have taken and still take a premier position.

A Walk in the West Park near Horticultural Hall, Fairmount Park, Philadelphia.

In later years the garden of Caleb Cope stood out prominently, it having at one time been presided over by the late Professor Thomas Meehan (honored name); it was during his superintendency of Mr. Cope's garden, about sixty years ago, that the first *Victoria regia* to be flowered in the United States, was cultivated, the plant having been cared for by Mr. Meehan.

Dundas's garden was also a noted one, interesting as well for having been where the much esteemed and highly respected superintendent of the United States Botanic Garden at Washington, D. C., William R. Smith, father of the S. A. F. charter, did among his first gardening work in his adopted country.

Philadelphia has, too, the distinction of having had the first, and probably the most famous botanical garden

Sunken Garden near Horticultural Hall, Fairmount Park, Philadelphia.

Some Old Time Leaders in the Profession

JOHN BARTRAM.—We have already referred to the Bartram botanic garden. Its founder, John Bartram, whom Linnaeus designated as the greatest natural botanist in the world, was born at Marple, near Darby, Pa., March 23, 1699, and died September 22, 1777. He was a Quaker farmer, and became interested in botany after he had reached the age of 24. In 1728, at Kingessing, on the Schuylkill River, he founded the first botanical garden in America, which, together with his dwelling house (a photograph of which is reproduced herewith), forms part of the park system of Philadelphia. Bartram was the medium through which many American plants were introduced into European countries, especially rhododendrons and native cypripediums, and he brought many foreign plants to the United States. It is said of him that he was probably the first American to perform successful experiments in plant hybridization. His name is preserved in the moss *Bartramia*.

DAVID LANDRETH, the founder of the first American seed house proper, was born at Haggerston, Northumberland county, England, in 1752. On coming to America he made Philadelphia his home, entering the seed and nursery business in 1784. The location of his first store is now covered by the building 1210-1212 Market street. The raising of trees and the production of seeds were conducted on adjoining land. The business he founded is still operated by the family, the seed farms being at Bloomsdale, near Bristol, Pa.

BERNARD M'MAHON was an Irishman and came to this country for political reasons in 1796, and settled in Philadelphia, where he engaged in the nursery and seed business. His seed store, which was on Second street below Market, was a meeting place of botanists and horticulturists. It is thought that the Lewis and Clark expedition was planned at his house. His greenhouses were situated near the Germantown turnpike, between Philadelphia and Nisectown, and he became interested in all branches of horticulture. He published in 1806 the "American Gardener's Calendar," the first book of importance on American horticulture, long a standard work on the subject. M'Mahon died in 1816. His name is perpetuated in the shrubs known as *Mahonias*, now united with the *Berberis* by botanists.

ROBERT BUIST was a native of Scotland; he was born at Cupar, Fife, November 14, 1805, and died in Philadelphia July 15, 1880. From his establishment several of the men who afterward became famous in American horticultural annals, graduated; among them being the late Peter Henderson. Mr. Buist was a noted grower of roses; he improved the verbena, and through his instrumentality the double *Poinsettia pulcherrima* was introduced to the trade here. He was also the author of several books on horticultural subjects. The house of Buist is still operating, being conducted by descendants of the founder.

JOHN SHERWOOD was another Scotsman who made Philadelphia his home. He was famed as a grower of roses and camellias; he originated Sherwood's Musk Cluster, a popular noisette rose, and camellias *Sherwoodii* and *Mrs. Cope*. He died in 1883 in his seventy-seventh year. The late Professor Meehan said of him: "To have an hour with Sherwood was always regarded as better than medicine, and possibly few have ever passed from gardening circles in Philadelphia more esteemed." Mr. Sherwood was one of the oldest supporters of the Pennsylvania Horticultural Society.

PETER MACKENZIE, another Scot, was a noted grower of hardwooded plants, especially camellias. He originated the famous camellia *Jenny Lind*, which was sold to a London (Eng.) purchaser for two hundred guineas.

ANDREW DRYBURGH.—The name of Andrew Dryburgh is remembered as that of one of the noted camellia

Henry A. Dreer.

Founder of Firm of H. A. Dreer, Inc., Philadelphia.

growers; he had the finest and largest specimen plants in the United States, and probably has never been equalled as a grower of the camellia anywhere. He, too, was a native of Scotland.

DAVID FERGUSON, also a Scotsman, was an importer and grower of hardwooded plants, many of which he supplied to the Southern States. He excelled in the cultivation of *Acacia pubescens*, the propagation of which he thoroughly understood.

JOHN RITCHIE was an expert in the cultivation of camellias, roses, and azaleas. He contributed a number

William F. Dreer.

President Henry A. Dreer, Inc., Philadelphia.

of articles on the subject of steam heating as applied to greenhouses, which attracted considerable attention. Mr. Ritchie served with the late Professor Meehan for six years in the City Council Chamber.

JOHN DICK, a partner of John Ritchie, was noted as a grower of camellias and hardy roses. Both Mr. Dick and Mr. Ritchie hailed from the Land of the Heather.

HENRY A. DREER, the founder of the great horticultural house which bears his name, was a native of Philadelphia, where, at the age of twenty years, he commenced business with Mr. Henry Hirst, in 1838. The first store occupied by the firm was located at 97 Chestnut street (old style numbers), the site of which is now covered by the handsome building of the Bank of North America. The connection of Mr. Hirst with the enterprise was brief, and Mr. Dreer continued to conduct it alone. In 1848 the store was removed to 59 Chestnut street; in 1858, to 117 Chestnut street (new number, 327), and in 1863, the present roomy and attractive building at 714 Chestnut street was bought, and adapted to the needs of the rapidly increasing business. Thus for nearly seventy years the house has been located on the principal business street of Philadelphia.

Henry A. Dreer died in December, 1873, leaving to his son, William F. Dreer, the task of developing the seed and nursery establishment and of fostering the valuable trade created by a lifetime of patient and conscientious effort. The gigantic proportions which the house has assumed are well known to the readers of *The Florists' Exchange*.

The original nursery grounds were located for the first eleven years at the historic Hamilton estate of the "Woodlands" upon Woodland avenue, then known as Darby road. This property was deeded to Andrew Hamilton by William Penn in 1704. In 1850 the nurseries were removed to a square of ground upon Thirty-fifth street below Haverford avenue; they consisted of six small greenhouses heated by flues. The demand for building lots in the course of time necessitated the vacation of the plant, and in 1873 the houses were removed to the present site at Riverton, N. J., which was chosen as the permanent location of the business in 1868. The Riverton Seed and Plant Farm covers over one hundred acres, and over five acres are under glass, with two acres in addition covered by packing sheds, cold storage and lath houses.

In conducting this establishment seventy men are employed, and in the Spring and during the busy season as many as eighty-five are required at the nurseries; at the store about thirty persons are engaged. The manager at the nurseries is Jacob D. Eisele, who has risen from the ranks, having begun as a boy in 1876; George A. Stroblein is his assistant. Both are members of the Board of Directors.

After the death of the founder, Henry A. Dreer, in 1873, the business was conducted by his son, William F. Dreer, who became associated with his father in the concern in 1865. In 1892 the business was incorporated under the laws of the State of New Jersey, with William F. Dreer as president, who continues at its head. Herbert G. Tull, who came to the house in 1880, is secretary and treasurer.

The management of the store department is in the hands of J. Otto Thilow, who has been connected with the house since 1884. The flower seed and bulb department is in charge of George D. Clark.

The immense seed and plant growing establishment is now located at Riverton, N. J., and will be visited by the S. A. F. delegates in a body during convention week. There is very much of interest to see there and a most enjoyable and instructive outing is anticipated.

Among other Philadelphians who have left their impress on American horticulture, and who recently passed away, are Thomas Meehan, Thomas Cartledge and Joseph Kift. The work that each performed in his day and generation is yet fresh in the minds of our readers, and need only be referred to here.

Early Seed Houses.

As stated, the first American seed house was founded by David Landreth in 1784 in Philadelphia. The second was established by John Mackejohn in 1792; third by William Leeson in 1794; the fourth by Bernard M'Mahon in 1800, all of Philadelphia. Among these M'Mahon, next to Landreth, seems to have been the most noted. He exported large numbers of seeds of native plants to Europe. His 1804 catalogue, for the export trade, contained about 1,000 species of trees, herbs, and shrubs. He, along with David Landreth, distributed seeds of the plants collected in the Lewis and Clark expedition.

Early Horticultural Literature in Philadelphia

The City of Brotherly Love has at all times been noted for the interest that it has taken in the dissemination of literature on horticultural subjects, and at the present day some of the best informed writers on matters connected with horticulture are to be found among the gardeners of this vicinity, both professional and non-professional.

late as 1857. For fifty years it remained the best American book on general gardening.

In the early part of the nineteenth century, Philadelphia was the home of William Cobbett, who published there a federalist paper known as "Peter Porcupine's Gazette." His writings were so strenuous, however, that he was forced to flee the country. Returning to America he resided upon a farm in Long Island. He kept a seed store in Fulton street, New York, in 1818, and was a competitor of Grant Thorburn, with whom he had some lively controversies in the daily press concerning the introduction of rutabaga into this country.

Robert Buist, seedsman, published in 1844 what was probably the second book devoted to a special flower to appear in America; it was the "Rose Manual," and went through at least four editions. Other books written

complished and conscientious of American horticulturists. Mr. Meehan also conducted "Meehan's Monthly" until the time of his death. The "Illustrated Floral Magazine" was started in 1832 by David Landreth, the second. Mr. Landreth also published an American edition of G. W. Johnson's "The Dictionary of Modern Gardening," which appeared in Philadelphia in 1847. The "Philadelphia Florist" completed its first volume in 1852-3. The subsequent volumes (at least three) were known as "The Florist and Horticultural Journal." It was a very creditable monthly magazine with colored plates.

The first pomological journal was probably Hoffer's "Orchardists' Companion," a quarterly, established in Philadelphia in 1814, and edited by Dr. Brincklé. Other pomological writings were "A Treatise on the Cultural Management of Fruit Trees," written by William For-

Cocos Weddelliana.
Stove House, Showing Marantas.

Fern House.
House of Kentias.

At Dreer's Greenhouses, Riverton, N. J.

One of the earliest works published in the city was "Essays and Notes on Husbandry," in 1799, by J. B. Bordley. In 1785 appeared Varlo's "New System of Husbandry." This is said, by Professor Bailey, to be in many ways a remarkable book, written by a man who had a remarkable experience. He was not an American, and the volume first appeared in the old country, but Varlo had lived in this country and was in sympathy with the American people. The book contained a "Farmers' and Kitchen Gardeners' Calendar." In 1806 Bernard McMahon published in Philadelphia his excellent "American Gardener's Calendar." This book enjoyed wide publicity, and the eleventh edition appeared as

by Buist were "The American Flower Garden Directory" and "The Family Kitchen Gardener."

Several important periodicals devoted to horticulture also first made their appearance in Philadelphia. "The Horticulturist" first appeared in 1815, being continued until January 1, 1859, when it was united with the "Gardeners' Monthly," a very excellent publication, indeed. This latter periodical was continued until the close of 1887 when, upon the death of its publisher, Charles Marot, it passed into the hands of the "American Garden," New York. The "Gardeners' Monthly" had a long and useful career under the editorial management of the late Thomas Meehan, one of the most ac-

syth, the American edition of which was brought out by William Cobbett in New York and Philadelphia in 1802. The first American pomological book was William Cox's "View of the Cultivation of Fruit Trees," published in Philadelphia in 1819; "a work," says Professor Bailey, "known to students of horticultural literature for the uniform completeness and accuracy of its descriptions. A feature of it were the excellent woodcuts of varieties of fruits. Cox had 100 cuts of apples, 63 of pears, 15 of peaches, 17 of plums, 3 of apricots, and 2 of nectarines. This makes 200 engravings, which would be considered liberal illustration even at the present day."

Horticultural Hall, Fairmount Park, Philadelphia.
Erected during Centennial, 1876.

A Modern Range of Private Greenhouses on Estate of Mr. P. A. B. Widener, Ogontz, Pa.

Courtesy of Lord & Burnham Company, New York.

It was built in 1682, and for many years was used as the State House for the Province of Pennsylvania. It was taken to its present location many years ago from its original site in Letitia street.

The Belmont Mansion, where the delegates will be entertained by the local club on the Friday of the convention, is located in a beautiful part of Fairmount Park. The mansion was the Revolutionary country seat of Judge Richard Peters, an eminent patriot, who was then acting as secretary of war. Washington, when president, and Lafayette, among many other distinguished persons of a century ago, were entertained here. A walnut tree, planted by Lafayette at that time still flourishes. The mansion is now used as a restaurant, and has a station on the Park trolley line.

On the bank of the river below Belmont may be seen a little house which is called "Tom Moore's Cottage," although the statement that the Irish poet once lived there has never been verified. The shady walks of Belmont Glen connect the two houses.

Fairmount Park can be reached by quite a number of routes, and by both steam and trolley cars. Situated within its extensive territory are many monuments and structures of much historical interest.

The Wissahickon Park, the scenery in which has been pronounced the most charming in the world, is also well worthy of a visit. The lower portion of it may be reached by the Ridge avenue cars and the Norristown branch of the Reading Road to Wissahickon station, and the upper portion by the Pennsylvania Railroad, Chestnut Hill branch, by taking a walk of some distance. Wissahickon Park is kept as nearly as possible in its wild state, and it is estimated that more than 200,000 trees clothe its steep and picturesque sides.

There are also numerous small parks within the city boundaries, among which may be mentioned the William Penn Treaty Park, on the Delaware River, in Kensington. It was here that Penn is said to have made that agreement with the Delaware Indians in 1682, which, as Voltaire remarked, "was never signed and never broken." The site of the famous elm tree, under which the compact is said to have been made, is marked by a small, plain monument, the traditional tree having been blown down in 1811.

Girard Park, in the southern part of the city, was the homestead and farm of Stephen Girard.

Vernon Park is particularly interesting to horticulturists. It is eight acres in extent, and on the occasion of its opening, on July 4, 1893, a great meeting was held in honor of Professor Thomas Meehan, when a silver memorial was presented to him by the citizens of Philadelphia, in recognition of his eminent endeavors on behalf of the park system.

This park was the homestead of one branch of the Wister family, and the old colonial mansion still stands amid a great grove of trees in the center of the park. Many of the trees in this place were collected by Kin, an eccentric botanical collector of the early part of the past century.

Willow Grove.

This is one of the suburban pleasure parks, and has been selected as the spot for the entertainment of the

ladies of the convention on Thursday afternoon. The grove is 23 miles north of City Hall, on York road, the ancient turnpike, which continues North Broad street into the country.

The trolley ride to Willow Grove is extremely interesting. Grand trees shade the ancient highway, which winds through pleasant dells and over hills that give wide views of a most charming country, many parts of which are of great historical interest. Fine country seats, some of them going back to colonial times, border the road, and here and there quaint old stone houses abut upon it, and speak of the peaceful and prosperous past. The grove itself is an extensive area, with woodlands, lakes and streams, all harmonizing into a picturesque whole.

"Cities of the Dead."

There are a number of notable cemeteries in Philadelphia, chief among which is Laurel Hill. This

burying ground covers the high eastern bank of the Schuylkill River, between the East (Fairmount) Park and Wissahickon Park. The Ridge avenue cars go to its north gate.

This cemetery was founded in 1835, and next to Mount Auburn (near Boston) is the oldest suburban cemetery in the United States. It now contains nearly one hundred acres. The principal entrance is that to North Laurel Hill, where an archway through a fine temple-like structure, admits one to the grounds. Near the entrance is a group of statuary representing "Old Mortality" at his favorite occupation of restoring defaced tombstones, pausing a moment to converse with Sir Walter Scott, which scene will be recalled by all readers of that particular volume of the Scottish novelist. This group was designed by Thom, a self-made Scottish artist.

Belmont Mansion, Fairmount Park, Philadelphia.

Where S. A. F. will be entertained, Friday, August 23, 1907.

Modern Commercial Plant and Flower Growing in Philadelphia

A Brief Historical Sketch

By W. H. TAPLIN

For many years past Philadelphia has been recognized as a horticultural center and in partial proof of this may be cited the fact that the Pennsylvania Horticultural Society and the Philadelphia Florists' Club are among the oldest and most flourishing organizations in their respective classes now in existence in our country. Amid such surroundings and

strong savor of Scotland, for among the best known men of that period I found Buist, Dick, Ritchie, Ferguson and Sutherland, and even in a later generation we find Graham, Craig and Anderson. Evidently, the "Land o' Cakes" has made good from a horticultural point of view.

Robert Buist was a florist of the old school, a

don firm, thus giving Philadelphia the honor of introducing this fine plant to the American trade. But Buist's place in West Philadelphia has long been but a memory, and the site has been used for building lots.

The establishment of John Dick was also among the Darby road colony, and there were grown camellias and azaleas in large numbers, besides a great variety of flowering and foliage plants, some of which could not now be found among the trade of our city.

Then there was the Ferguson place near Laurel Hill Cemetery, that beautiful resting-place of the departed on the banks of the Schuylkill, from which the florists of the neighborhood derived much of their revenue. Ferguson & Son also grew camellias in tree-like specimens, and handled a large and

under such influences it is only natural that commercial plant growing should have been a long established industry and without attempting to go back to the beginning within the brief limits of this article, there are many names prominent in the trade that promptly suggest themselves.

Among the names that impressed themselves upon my youthful memory as being men of mark in the Philadelphia trade, there seems to have been a

man of some peculiarities and a great deal of information, and his place was an interesting one to visit in the early seventies, owing to the variety of plants he grew. It will be recalled by some of the older brethren of the profession, that when Bernard Roezl, the collector, first brought the double poinsettia, *P. pulcherrima plenissima*, from Mexico, about the year 1874, that he divided the original importation of this plant between Robert Buist and a Lon-

varied stock of plants and flowers. And when in after years this property was thrown upon the market, it was taken by John Westcott, who had decided to adopt the peaceful life of a grower in lieu of the strenuous, though profitable, business of retailing flowers, and has since been known as Westcott's Laurel Hill Nurseries.

During the early period of my recollections the establishment of Hugh Graham was located in the central part of the city, at Eighteenth and Thompson streets, and from this, and at a later period

1. Made-up Kentia Belmoreana in 8-in. pot.

from the new location on the New road, were sent some remarkable groups of crotons and other foliage plants to the exhibitions of the Pennsylvania Horticultural Society. Of late years the output of this large establishment has been more confined to carnations, chrysanthemums, roses, palms, ferns and other decorative stock, chiefly for the large retail trade that has been enjoyed by this firm.

Among the information absorbed in my early youth was the fact that a man named William K. Harris used to grow geraniums that were of remarkable quality at his place out on the Darby road, and a few years later Lillum Harris[?] was secured from Bermuda, was developed and introduced by this same man. From this Mr. Harris proceeded to grow Ficus elastica in a superior manner, and up to this day his establishment is famed for the Eas-

Establishment of Godfrey Aschmann, Philadelphia, Pa.

ter plants, the Christmas specialties, and the good Boston ferns that are produced in such large and paying crops. It takes a man of versatility to grow good plants, to be a dabbler in poetry, and also to be able to hold up his end on the bowling alley or the shooting ground, yet Mr. Harris is "there with the goods," as his office boy might remark, and is deservedly respected and popular.

Though located at Riverton, New Jersey, the Dreer establishment may properly be considered a Philadelphia concern, the headquarters of this largest floral aggregation of our city being located at 714 Chestnut street. This establishment has made wonderful growth in the past 20 years, and its thorough system and business-like methods have been frequently commented upon in the trade papers, and will be admired by the many visitors who will enjoy the firm's hospitality during convention week. This business is a monument to J. D. Eisele, the very able manager, and it is a pleasure to note the success of so hard a worker.

The area devoted to palm growing at Dreer's is, of course, the largest in our neighborhood. Then there are the establishments of Charles D. Ball at Holmesburg, of the Jos. Heacock Company, at Wyncote, of Lemuel Ball at Wissinoming, each of which devotes a large area of glass to palms, in addition to the various smaller lots of these useful plants that are found in various places of less magnitude in and about the city.

Taken altogether, it is probably a conservative estimate that fully 350,000 square feet of glass are occupied in palm growing in the neighborhood of Philadelphia, so it will be understood that this industry is a flourishing infant.

It is now fully two decades since our old friend Edwin Lonsdale conducted his establishment on Dney's lane, Germantown, and those familiar with the trade at that time will recall the fine houses of fuchsias that Mr. Lonsdale found no difficulty in selling. Beautiful plants they were, too, perfect pyramids of healthy foliage and fine flowers. Later on, when Mr. Lonsdale removed to the vicinity of Chestnut Hill, he was the first to grow a variety of orchids for the trade in Philadelphia. There were various lots of *Cypripedium insigne* in the hands of the city growers, but at that period, with the exception of Hugh Graham and Lonsdale, there were very few orchid growers for the trade. Since then, Julius Wolff, Jr., Twenty-eighth and Dauphin streets, has entered upon this field, and there are various smaller lots of these most interesting and beautiful plants to be found about the city.

In the early days, Charles D. Ball, Craig & Brother and Henry A. Dreer composed the most active con-

cerns in the production of small ferns for ferneries, and hundreds of thousands of these useful plants were turned out yearly. Now the fern output runs into the millions, the majority of them coming from the Dreer establishment.

The Cut Flower Business.

The cut flower crop of the city has gone forward by leaps and bounds within the recollection of the writer, and from such places as Baumann's in the northern part of the city, and the original plant of Robert Scott & Son in the southern end, to the large, well-kept, and convenient modern establish-

ments of the Burtons, the Heacock Company, Farenwald and others seems a far cry as we look backward. The Evans establishment at Rowlandville was much in evidence at one time, for from there was sent forth with much enthusiasm and printer's ink, the hybrid tea rose, Wm. Francis Bennett, and also the h. p. rose, Her Majesty, the respective stocks of these roses having been secured by Mr. Evans from the English originator. At that period, a visit to the Evans place was a matter of some ceremony, these floral treasures being kept behind carefully locked doors, in order to prevent any tampering with the stock by unauthorized or suspicious persons, the latter, of course, being people outside of the trade. Now, the cut flower places of the city are wide open to the visiting multitude and will be found to compare on equal terms with those of similar size in other cities.

We have no establishments of a million feet of glass, but there are several of no mean capacity, and their output is very frequently found among the cup-winners at the various exhibitions.

For many years the product of the most of the cut flower growers was distributed by means of their own salesmen, who traveled many weary miles each day with an assortment of boxes and baskets. But the past decade has witnessed a great change in this respect, and now it may be said that fully three-fourths of the flowers are handled by the numerous commission dealers.

The demand for special crops of Easter and Christmas plants has been well met by the Philadelphia growers for many years. Among the largest producers of this class of stock are W. K. Harris, Robert Craig Company, William Graham Company, Robert Scott & Son, and George Anderson, though this brief list by no means covers the ground, for there are also Hahman, Koehler & Son, Griffin Brothers, Jacob Becker, Joseph Beavis, J. W. Colflesh and lots more, and each of them does something well, and some of them many things.

Retail Men as Growers.

Some of the retailers also sigh for the flesh-pots of the grower's life, and among these we find H. H. Battles, R. Crawford & Son, H. Weiss and J. J. Habermehl's Sons, most of these greenhouses being located outside the city limits.

In conclusion, we may remark in all modesty, that if you don't believe that Philadelphia is still in the running, floriculturally, then come and see during the third week of August, or any other time that may be convenient.

Godfrey Aschmann's House of Araucarias.

Nursery Business About Philadelphia

Sketch of its Past and Present

BY JOSEPH MEEHAN

The writer's recollection of the nursery business in the vicinity of Philadelphia dates back to the year 1859. At that time the largest nursery was that of Buist's at West Philadelphia, approached from the Darby road, now known as Woodland avenue. There was also Maupay's nursery, at the Rising Sun, on Germantown avenue; Saunder's of Germantown; Bright's on the York road; Kieffer's, at Roxborough; Meehan's, at Mount Airy; Haines', at Cheltenham and Corson's at Plymouth Meeting. Besides these Dick of the Darby road, and Woltemate of Germantown kept a few shrubs and trees, though these men were mainly florists.

Of the nurserymen named Buist led all at that time in the variety of his stock. It was his aim to have everything of worth that could be procured, and his greenhouse department was conducted on the same broad basis.

Maupay's nursery was not extensive, but it appeared to the writer to bear the marks of having been on a better basis at some previous time than it did then.

Saunders had a small place, not over an acre or so, in what is now the heart of Germantown.

Bright's had mainly nice evergreens; Kieffer's was made up of odds and ends, but many rare sorts were there.

Meehan had three acres, consisting of a fair assortment for the day; while Corson had a few sorts only, which he sold chiefly to nearby neighbors.

Of all these concerns there exist to-day but Meehan's firm, and that of Haines; together with Woltemate, the florist.

But since the date first given there have come up the nurseries of Miller & Yates, and Andorra Nurseries, so that at the present time Philadelphia is represented by the firms of Thomas Meehan & Sons; Thaddeus N. Yates, and W. Warner Harper (Andorra). These firms with their country branches, represent many hundreds of acres of nurseries, the stock being largely of an ornamental nature, besides their greenhouse establishments.

Although Dreer is largely in the plant and seed business and is often thought of in this connection, his establishment at Riverton, N. J., is noted for its fine stock of herbaceous plants and shrubs and trees, so that he can well come under the head of Philadelphia nurserymen, headquarters being in Philadelphia. And the nurseries of the Moons—Wm. H. and Samuel C.—at Morrisville, Pa., are looked on as pertaining to Philadelphia, both being of an extensive nature.

There is no doubt that the early fame of Philadelphia in the nursery way was due to Robert Buist, the founder of Buist's nurseries. His ambition was to grow everything that could be grown, and what could not be got at Buist's, both in the tree and greenhouse plant line, could be got nowhere else.

In later years the same could be said of Meehan's. The founder, Thomas Meehan, had in his small 3-acre concern a great variety of trees and shrubs, the nucleus, in fact, of the larger nurseries which succeeded the other in later years, and for years past the nursery has been famed for its great variety of hardy trees, shrubs and perennials.

And the later firms—but of many years standing now—the Yates and the Andorra, have contributed also toward the dissemination of rare trees, shrubs and plants. The thousands of handsome grounds in Philadelphia and its vicinity, handsome chiefly because of the grand assortment of trees and shrubs they contain, attest what these nurseries have done for the advancement of horticulture.

the founding of the station. Addresses will be made by prominent personages. Arrangements will be made to accommodate a large number of people. On the previous day, August 28, the New York State Fruit Growers' Association will hold a joint meeting at the station, which will be continued through the evening in a tent provided for that purpose. All interested are invited to be present.

Greenhouses of Thomas Meehan & Sons, Germantown, Pa.

And the writer would again call attention to the fact of the late Robert Buist being entitled to great praise for what he did for the nursery business, for not only had he the best nursery of his day of any that preceded him, but his establishment was the home of many Old World gardeners who later started nurseries and florists' establishments of their own.

THE NEW YORK AGRICULTURAL EXPERIMENT STATION began its active existence in 1882. It is proposed to hold a field day on the grounds on August in recognition of the twenty-fifth anniversary of

RICHMOND, VA.—The Southern Nurserymen's Association will hold its annual meeting in the Jefferson Hotel Wednesday and Thursday, August 14 and 15. Wholesale and retail nurserymen from every Southern State are expected to be present, and short, practical talks will be a feature of the program. The officers of the association are: John A. Young, Greensboro, N. C., president; C. M. Griffin, Jacksonville, Fla., vice-president, and Charles T. Smith, Concord, Ga., secretary and treasurer. Many of the visitors will go from Richmond to the Jamestown Exposition.

Office of Thomas Meehan & Sons, Germantown, Pa.

Office of Wholesale Department of Thomas Meehan & Sons, Inc., at Dreshertown, Pa.

New Greenhouse Plant of Florex Gardens, Inc., North Wales, Pa.

Among the many establishments in the vicinity of Philadelphia worthy of a visit by the S. A. F. O. H. delegates is that of the Florex Gardens located at North Wales, Pa. This is a new range being erected this year by the King Construction Company, North Tonawanda, N. Y. One of the structures of particular interest is the large greenhouse, illustrations of which appear herewith. This house is 154 feet wide, single span, by 425 feet long on one side and 575 feet on the other, making the west gable 218 feet wide. The height of the house is 33 feet and roof 81 feet on each side, supported by five rows of posts, 8 feet 3½ inches in the line and 26 feet apart across the house. Over 2100 boxes of 16x24 double thick glass were used in glazing the house, and 30,000 lineal feet of 1¼-inch pipe for the heating, most of the pipes being hung from the roof.

It takes 45,000 plants to fill the 28 beds and benches, which if put together would reach nearly 2½ miles, with four rows of plants to a bed. One half of the house is planted in raised benches and the balance in solid beds raised about 8 inches from the line of grade. The house was started about April 10 of this year, and was erected by June 15—ten weeks in all; a very short time for a house of such a width, where the big scaffold had to be taken down six times and rebuilt. As fast as the builders had about 24 feet completed, the pipe fitters and glaziers started in with their work, and after they were finished, the scaffolding for 24 feet or so, was torn down and erected on the other end, thus making it necessary to keep building and removing the scaffold continuously. Some 75,000 feet of lumber was used in building the scaffold, all of which and more, too, was used in benching the house.

The side wall for a distance of 4 feet from the grade is made of ash concrete, 4 inches thick, reinforced by wires run lengthwise, every 6 inches. Into this wall

1018 Market St., Phila.

the pipe carriers are nailed for side coils. The plants were installed in the finished end about June 15 and as the house progressed, more were planted until the entire number was set out about July 15.

A house, 32x130 feet to which another of the same size is to be added very soon, is near the large house, and both will be used for stock plants. A brick office building, 40x60 feet, will soon be under roof; and the boiler house is now under way.

The Burpee Building,
475 North Fifth St., Phila.

As many as 75 men of the various trades were employed during the building of the house, for many weeks, all of whom were local, under charge of a representative of the King Construction Company.

North Wales is reached from Philadelphia by trains on the Reading system, leaving the Terminal, Twelfth and Market streets, hourly in the afternoon. The greenhouse is immediately at the station.

Interior of Store of Henry A. Dreer, Inc., 714 Chestnut Street, Philadelphia.

Myers & Samtman, Chestnut Hill, Pa.

This firm is well known to the trade as growers of American Beauty roses exclusively. Of particular interest at their establishment just now is the new seedling pink rose, flowers of which were exhibited at the recent exhibition of the American Rose Society at Washington,

Present Day Seed Houses.

Following is a list of the principal seed houses in Philadelphia to-day:

W. Atlee Burpee & Company, 475 North Fifth street; also Sunnybrook Farms, Swedesboro, N. J., and Fordhook Seed Farms, Doylestown, Pa.

Business Office of W. Atlee Burpee & Company, Philadelphia, Pa.

D. C., where the variety scored 81 points, receiving a certificate. Experts pronounce this new comer as being in color and form very much like Baroness Rothschild. In substance and foliage it is said to be the equal of American Beauty, one of its parents. As a producer, the originators say they can cut a crop every eight weeks.

This rose will not be disseminated until 1909. It is being tested by the E. G. Hill Company, Richmond, Ind., and can be seen at that establishment during the Winter of 1908.

The variety, which is a cross between American Beauty and Safrano, was obtained by P. H. Meehan, when foreman for Myers & Samtman, who have set out 300 plants of it.

Visitors to this establishment will find much of interest, and a visit should prove very profitable.

DAVID RUST.

The Henry F. Michell Company.

In this issue we illustrate the establishment of the well-known firm of Henry F. Michell Company, Philadelphia. It is certainly remarkable to note what progress this concern has made in the past few years. The firm, which was established in 1891, has up to the present time developed into one of the largest retail and wholesale houses of its kind in the United States. They have now a number of traveling men on the road, and are daily adding new customers to their already large list.

Bulbs form one of their particular strongholds. We are told that their importations for this year have eclipsed the five million mark.

The firm has gotten up several attractive souvenirs, which they are desirous of distributing to the callers in the trade who should make it a special object to visit their large and well equipped establishment.

Robert Craig Company.

This establishment, which is located at Forty-ninth and Market streets, will be the mecca for most of those who are in Philadelphia for the convention, as all will want to see the new fern *Nephrolepis Amerpohli*, which this firm is growing for Wm. P. Craig. There is a large stock of this grand fern in all sizes, and one great feature about it is, that it is equally good as a small plant as in large specimens; therefore its usefulness is unlimited. It can be employed extensively for fern pans. If anything it grows more freely than any other variety of this species.

Of the Robert Craig Company's stock there are five houses filled with *Ficus pandurata*; one of these houses, 200 feet long, is filled with this plant in green tubs; these are branched plants, and are all grand specimens. This new *figus* is becoming more popular every month; it is a very desirable subject for the house, and no florist will do wrong in recommending it.

This establishment has always been noted for *Dracaena terminalis*; at present there is a grand lot of these to be seen. Four houses are filled with dwarf oranges, all of which are well set with fruit.

Adiantum hybridum has proven such a useful plant for cut fronds that this firm has made a specialty of it, and at present has a fine stock on hand.

Robert Craig has for years been a strong advocate of crotons, not only for planting out but also for house decoration, and at present he has about ten thousand plants of all sizes in fine shape.

There are ten thousand cyclamen in 5 and 6-inch pots, growing in cold frames under slats; these are very attractive stock.

There are many houses of chrysanthemums of all the leading commercial varieties; all the latest introductions are also being tried. There are likewise many of the new single varieties being grown this year; these have been in great demand in Europe for two years past.

Store of Johnson Seed Company, Philadelphia, Pa.

Society of American Florists and Ornamental Horticulturists.

Department of Registration.

The Dingee & Conard Company, West Grove, Pa., submit for registration rose President Roosevelt, Safrano × American Beauty. Color bright satiny pink; flower large, full and double, stiff stemmed; height 15 to 20 inches, fragrant; foliage good.

Prizes for Essays.

Samuel Murray, of Kansas City, Mo., offers prizes of \$30 and \$20 for the following essay, to be presented at the convention, on the subject: "Comparative Worth in the Community and to Horticulture and Floriculture."

First: The man who is a gardener and florist, having a store and conservatory in the city, conducts a high-class business, has greenhouses in the suburbs; grows plants and cut flowers for his store; has a good business in Spring; bedding plants and does all in his power to increase the sale of hardy perennials, setting forth to his patrons on every occasion possible the beauty and charm of the hardy flower garden plants, shrubs and trees and bulbs in the Fall.

Second: The man who conducts a store and conservatory in the city, has a high-class business, but does not have any greenhouses; buying all his plants and cut flowers at wholesale.

P. J. HAUSWIRTH, Secretary.

The Philadelphia Florists' Club.

The Philadelphia Florists' Club—the first of its kind in America—was organized in 1885, preparatory to the 1886 S. A. F. convention in that city. It was incorporated in 1888; the officers then were Robert Craig, president; Charles D. Ball, vice-president; Thomas Cartledge, treasurer; D. D. L. Farson, secretary. Besides these the other charter members were: John Westcott, A. B. Cartledge, Robert Kift, W. W. Coles, Edwin Lonsdale, William K. Harris, Henry F. Michell, and J. W. Colflesh.

The club has a membership of 276; 75 of these are associate members who are not in the florist business, but who belong to the organization in order to participate in the bowling and other social benefits.

The present officers are: S. S. Pennock, president; Fred. Hahman, vice-president; J. W. Colflesh, treasurer; David Rust, secretary. The meetings are held the first Tuesday evening of every month in the club room in the basement of Horticultural Hall.

The development of the social feature of club life has always received marked attention at the hands of the Philadelphians, and to them more than to any others may be attributed the great interest in the bowling and shooting competitions held in connection with the S. A. F. gatherings. They are particularly favored in having their own alleys, which adjoin their meeting room, of which the utmost advantage is taken. How the members excel in these sports, the well filled cases of trophies—tokens of triumph in hotly contested conflicts—bear testimony. As a class, there are no more genial or generous men to be found in the trade anywhere; none from whom a more cordial and fraternal welcome may be expected at all times, than the men who compose the Florists' Club of the City of Brotherly Love.

Whilldin Pottery Company.

This concern was established at 713 Wharton street, Philadelphia, in 1858, as a general pottery, but for the past 30 years its business has been the manufacture of flower pots, pans, and florists' ware exclusively. This firm is the originator of the standard flower pot as adopted by the S. A. F.

The pottery and general offices are located at 713 to 719 Wharton street, Philadelphia. In the pottery are three large kilns and very large storage rooms on all sides. The manufacturing department is equipped entirely with modern machinery, and also with every known facility to manufacture the best article in the quickest way. The business has grown to such an extent that no dull seasons are now known, it being difficult at times to keep the kilns idle long enough to make necessary repairs.

Branch offices and warehouses are maintained at Kearney and West Side avenues, Jersey City, N. J., and at Jackson avenue and Pearson street, Long Island City, N. Y. At both of these places large stocks are kept to supply the trade adjacent to these branches.

S. S. Pennock, President.

David Rust, Secretary;

J. William Colflesh, Treasurer.

Also Supt. of Trade Exhibit S. A. F. O. H.

F. Hahman, Vice-President; also Chairman Entertainment Committee.

Officers of Philadelphia Florists' Club, 1907.

At all times this firm is ready to manufacture a new style pot or pan as more up-to-date methods demand and they will also make any special designs or sizes that customers may require, the product being a good clean pot that gives every satisfaction.

The officers of the concern are: Wm. S. Emley, president; Wm. Galloway, secretary and treasurer, and John G. Whilldin, general manager. The latter has been connected with this firm 48 years, and the rapid progress made is almost wholly due to his energy and perseverance.

DAVID RUST.

We very much regret that, owing to pressure on our space by advertisements received late in the week, several other interesting illustrations, among them views of the bedding at Girard College, Philadelphia, where Edwin Lonsdale is superintendent, are unavoidably crowded out of the present issue. They will appear in future numbers.

Philadelphia's Wholesale Cut Flower Houses.

The following is a list of the houses in Philadelphia where cut flowers are sold at wholesale, several of the firms also dealing in florists' supplies:

William J. Baker, 1432 South Penn square.
Berger Brothers, 1235 Filbert street.
Eugene Bernheimer, 11 South Sixteenth street.
Fred. Ehret, 1403 Fairmount avenue.
John McIntyre, 1601 Ranstead street.
W. E. McKissick, 1221 Filbert street.
W. J. Moore, 1235 Filbert street.
Leo Nlessen Company, Inc. 1209 Arch street.
Philadelphia Cut Flower Company, 1516-18 Sansome street.
S. S. Pennock-Meehan, Co., 1608-1618 Ludlow street.
Edward Reid, 1526 Ranstead street.

THE FLORISTS' EXCHANGE

S. S. Skidelsky, Reception. A. B. Cartledge, Shooting. Joseph Heacock, Hotels. Charles D. Ball, Finance and Ladies' William Graham, Bowling.

Chairmen of Convention Committees of Philadelphia Florists' Club.

THE ST. LOUIS FLORISTS' CLUB'S Midsummer meeting, which took place at Shaw's Garden last Thursday afternoon, was well attended by the members and their wives, notwithstanding the big rainstorm early in the day. The number in attendance reached 75. President Irish showed us all the points of interests, and after the inspection tour the party assembled at one of the large houses where tables and chairs had been placed for the meeting, to which all the ladies were admitted. President Irish occupied the chair, all the other officers being present. Chairman Smith of the trustees reported that the late picnic expenses were \$103.80. State Vice-President Young of the S. A. F. O. II. explained convention matters and rates announced in last week's issue, and said he looked for a large attendance. A special sleeper has been arranged, which costs \$6 each way. Two applications were filed—one by D. Bova, the other by L. M. Van Hook. The election of officers for the ensuing year resulted as follows: W. C. Young, president; George H. Augermuller, vice-president; A. J. Bentzen, secretary; Fred. H. Weber, treasurer, and Charles Schoenle, three-year term trustee. The club's choice for the next S. A. F. State vice-president fell upon William C. Smith. President Irish announced that Paul Roper, to whom the club had given a garden scholarship, had resigned his position, and that the club could recommend another appointee to fill out the term. The only applicant was Edwin Nojden of Kenosha, Wis., and the young man received the appointment. After adjournment the members and their ladies were served with ice-cream, cake and lemonade in plenty. Another trip through the garden was taken, and the ladies and the members thanked President Irish for the pleasant-afternoon they had spent.

ST. PATRICK.

LIST OF PHILADELPHIA HOTELS

NAMES	Location	American or European	Number of Rooms	Can Accommodate	Rate per Day

Godfrey Aschmann.

Godfrey Aschmann.

We present herewith a portrait of this well known plantsman, whose greenhouse establishment is located at 1012 West Ontario street, Philadelphia.

Mr. Aschmann at the present time has an exceptionally fine lot of plants, just suited to those who wish to stock up for the Fall trade. Of *Araucaria excelsa* there are about 2,800 plants in 5, 5½ and 6-inch pots, all healthy and strong; *Araucaria excelsa glauca* numbers 500 plants in 6 and 7-inch pots; *Araucaria compacta robusta*, 500 plants in 6, 7 and 8-inch sizes; these are a very even and well grown lot. There is a very large stock of *nephrolepis*; of *bostoniensis* there are 3,000 plants in from 4-inch up to 8-inch pots, of *Whitmani* over 1,100 plants in from 4 to 6-inch; of *Piersoni* 500 plants in 4 and 5-inch sizes; of *elegantissima* about 250 in 4-inch and 300 in 6-inch sizes. All of these ferns are just suited for growers to bring along for Fall and Winter trade.

In palms we noticed over 1,200 *Kentias Forsteriana* and *Belmoreana*, in from 4 to 6-inch pots, and about 400 *arecas* in 4-inch; there is also a nice lot of *latanias*, about 300, in 4-inch pots; of *Cocos Weddelliana* about 700 plants in 3-inch pots. A large block of *Cycas revoluta* is grown here every year; at present there are at least 500 plants, ranging from 5-inch up to 8-inch, with from 5 to 30 leaves.

Begonia Gloire de Lorraine is represented by a nice block of plants—400 in 2½-inch and 750 in 4-inch sizes. *Primula obconica* is always a good seller on this place; there are 1,200 plants in 3-inch pots. *Primula chinensis* is also grown very extensively; at present there are 1,800 plants in 4-inch sizes. Then we noticed 7,000 ferns, in 2½-inch pots, for fern dishes, and a fine lot of *Adiantum hybridum* in 6-inch pots, about 200 in the lot. Of *Asparagus plumosus nanus* there are over 2,500 in 3-inch and 1,000 in 4-inch. There is also a fine block of *figs* in 6-inch pots, and such other things as *solanums* and *hydrangeas* in quantity, all in good condition and worth going out to inspect.

Mr. Aschmann extends an invitation to all present at the Philadelphia convention to visit his establishment, where they will be accorded a hearty welcome.

DAVID RUST.

S. S. Pennock-Meehan Company.

The illustrations herewith show the spacious buildings and ribbon department of this well-known firm at 1608-18 Ludlow street, Philadelphia, Pa. A sketch of the progressive career of the young men composing the concern recently appeared in our columns. This firm is extensive handlers of cut flowers and florists' supplies, dealing also in various plant stocks for the trade. The establishment affords one of the best indications of the large cut flower business done in Philadelphia, and is well worth a visit by the convention delegates. A cordial welcome is assured at all times.

2. Old way of making 6-inch Pots (12 dozens is a Day's Work.)
3. Making 8-inch Pots—18 Pots a Minute.

The Whilldin Pottery Company.

The Leo Niessen Company

Leo Niessen, the founder of this firm, was formerly with the old concern of La Roche & Stahl. He started in business for himself on August 1, 1895, at 17 North Thirteenth street. Being at all times attentive to business, and very particular to watch all small details, he prospered, and as his trade increased we find him moving to more commodious quarters—first to Juniper street above Market, then to Thirteenth and Filbert, then to 1217 Arch street and finally to 1209 Arch street. Here the firm has erected a reinforced concrete building, six stories high, fitted with all modern conveniences. The firm uses the basement and two first floors for its business. The first or main floor in used entirely for handling cut flowers; the second floor for the offices and florists' supplies and general storage. In the basement is a six-ton per day ice machine. The icebox for flowers at this establishment is a room operated on the cold storage system; it is commodious and well arranged with movable shelves.

As business developed Mr. Niessen took in his brother Arthur as a partner with him. Arthur is the office man, having full charge of that department, and has developed a good system so that everything runs like clockwork, and like his brother he watches every little detail.

The firm handles a general line of flowers. In Winter it is very strong on orchids, roses, and carnations. The force numbers 27 employees, all young men; and a general appearance of hustle prevails whenever one visits the establishment.

DAVID RUST.

Office of Leo Niessen Company, Wholesale Florists, Philadelphia.

FLORICULTURE IN THE SOUTH.—In the 1906 edition of the Florists' Directory we find the names of 306 individuals and firms engaged distinctively in floral work in 11 Southern states those on the border not being taken into the illustration. Of this number 138 are located in 9 of the leading cities.

In these 11 states the 1907 Postal Guide lists 1,130 towns and cities which are of sufficient importance to have postoffices of the third class or higher, and the presumption is that few, if any, have less than 1,200

or 1,500 population. The federal census of 1900 gave these States nearly 18,000,000 population, while the estimate for 1906 raises this to over 20,000,000.

Thus we see but 306 florists for this large population, or 65,000 people for each florist. Only 138 of these are located in 25 cities with a population of about 1,000,000. This leaves 19,000,000 people for the other 168, or about 113,000 each.

Another view of the situation is obtained by deducting the 139 florists located in 25 cities and we have 1,105 towns with but 108 florists to supply their needs, or nearly 7 towns to each, with all the country trade left out of the consideration.

Now, if this does not furnish a plausible reason for the sending of thousands of dollars to distant states for plants and seeds, we will be glad to have a better one assigned. If it does not show that there is room for a large increase in Southern production the writer will have to modify his views on supply and demand. Not only this but in many particulars the current should be reversed and money should come South for stock which can be produced here to better advantage than in the Northern states.

By way of contrast we note that the State of Illinois with a population of 4,800,000 has 475 florists, about one to each 10,000 as against one to each 65,000 throughout the South. Chicago alone, with a population of about 2,000,000, has 120, which is near the average for the state.

From all these conditions and circumstances we arrive at our conclusions that the floral trade in the South is not living up to its natural opportunities, that it should be several times as extensive as to the numbers engaged in it in order to equal the State of Illinois, that the favorable opportunities in the South should reverse the present conditions.—The Southern Florist.

UNBURNABLE WOOD is a new product of France. At an exhibition in Bordeaux, it is reported, pine shavings, wood paper and cotton were treated with a protective preparation and then exposed to fire. A pile of shavings, pine kindlings and wood was set on fire and in the blaze were thrown shavings and sticks of wood impregnated with ignifuge, so called. When the fire had exhausted itself the impregnated shavings and wood were found to be simply blackened and charred; they gave out no flame. Paper and cotton fiber treated with the same solution when exposed to the flames were consumed slowly without a blaze. The formula for ignifuge consists of sulphate of ammonia, 27 oz. avoirdupois; borate of soda, 3 oz.; boric acid, 1 oz.; water 12.5 lb., or 1 gal.—Metal Worker.
